Mesogenesis

Gilly Elor

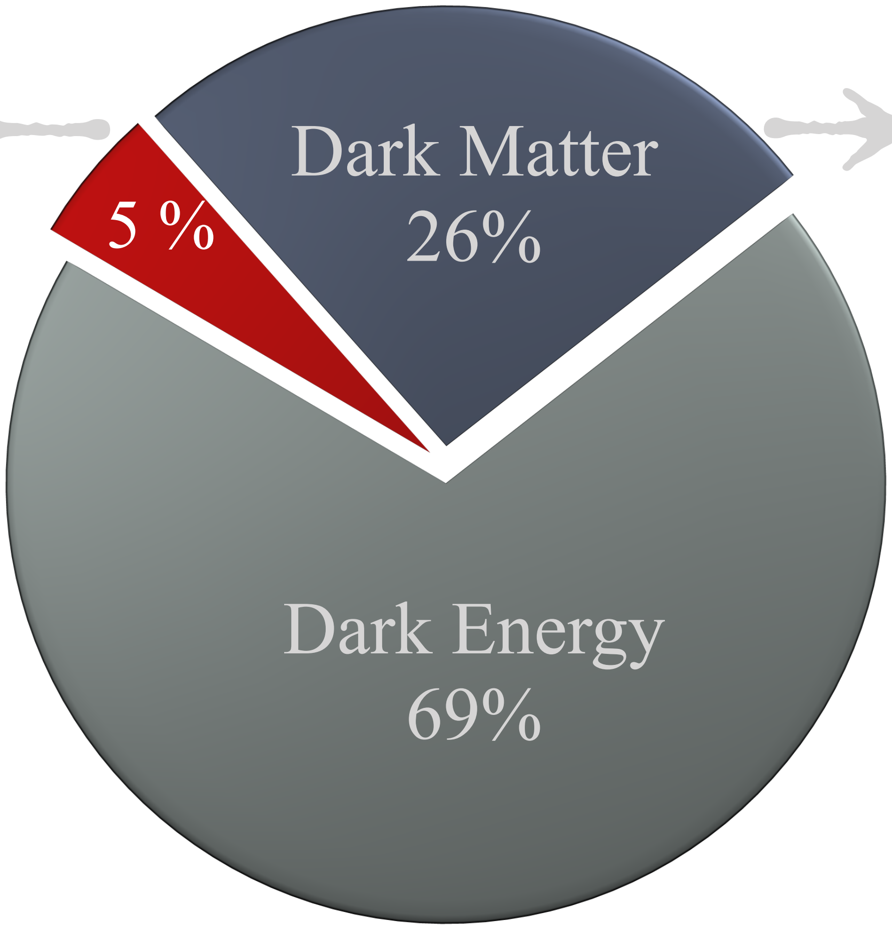
MITP Particle Theory Seminar

June 30 2021

What is the Universe Made of?

From cosmological measurements we know:

The stuff we understand —
stars, planets, you
(baryonic matter)
Only 5 %



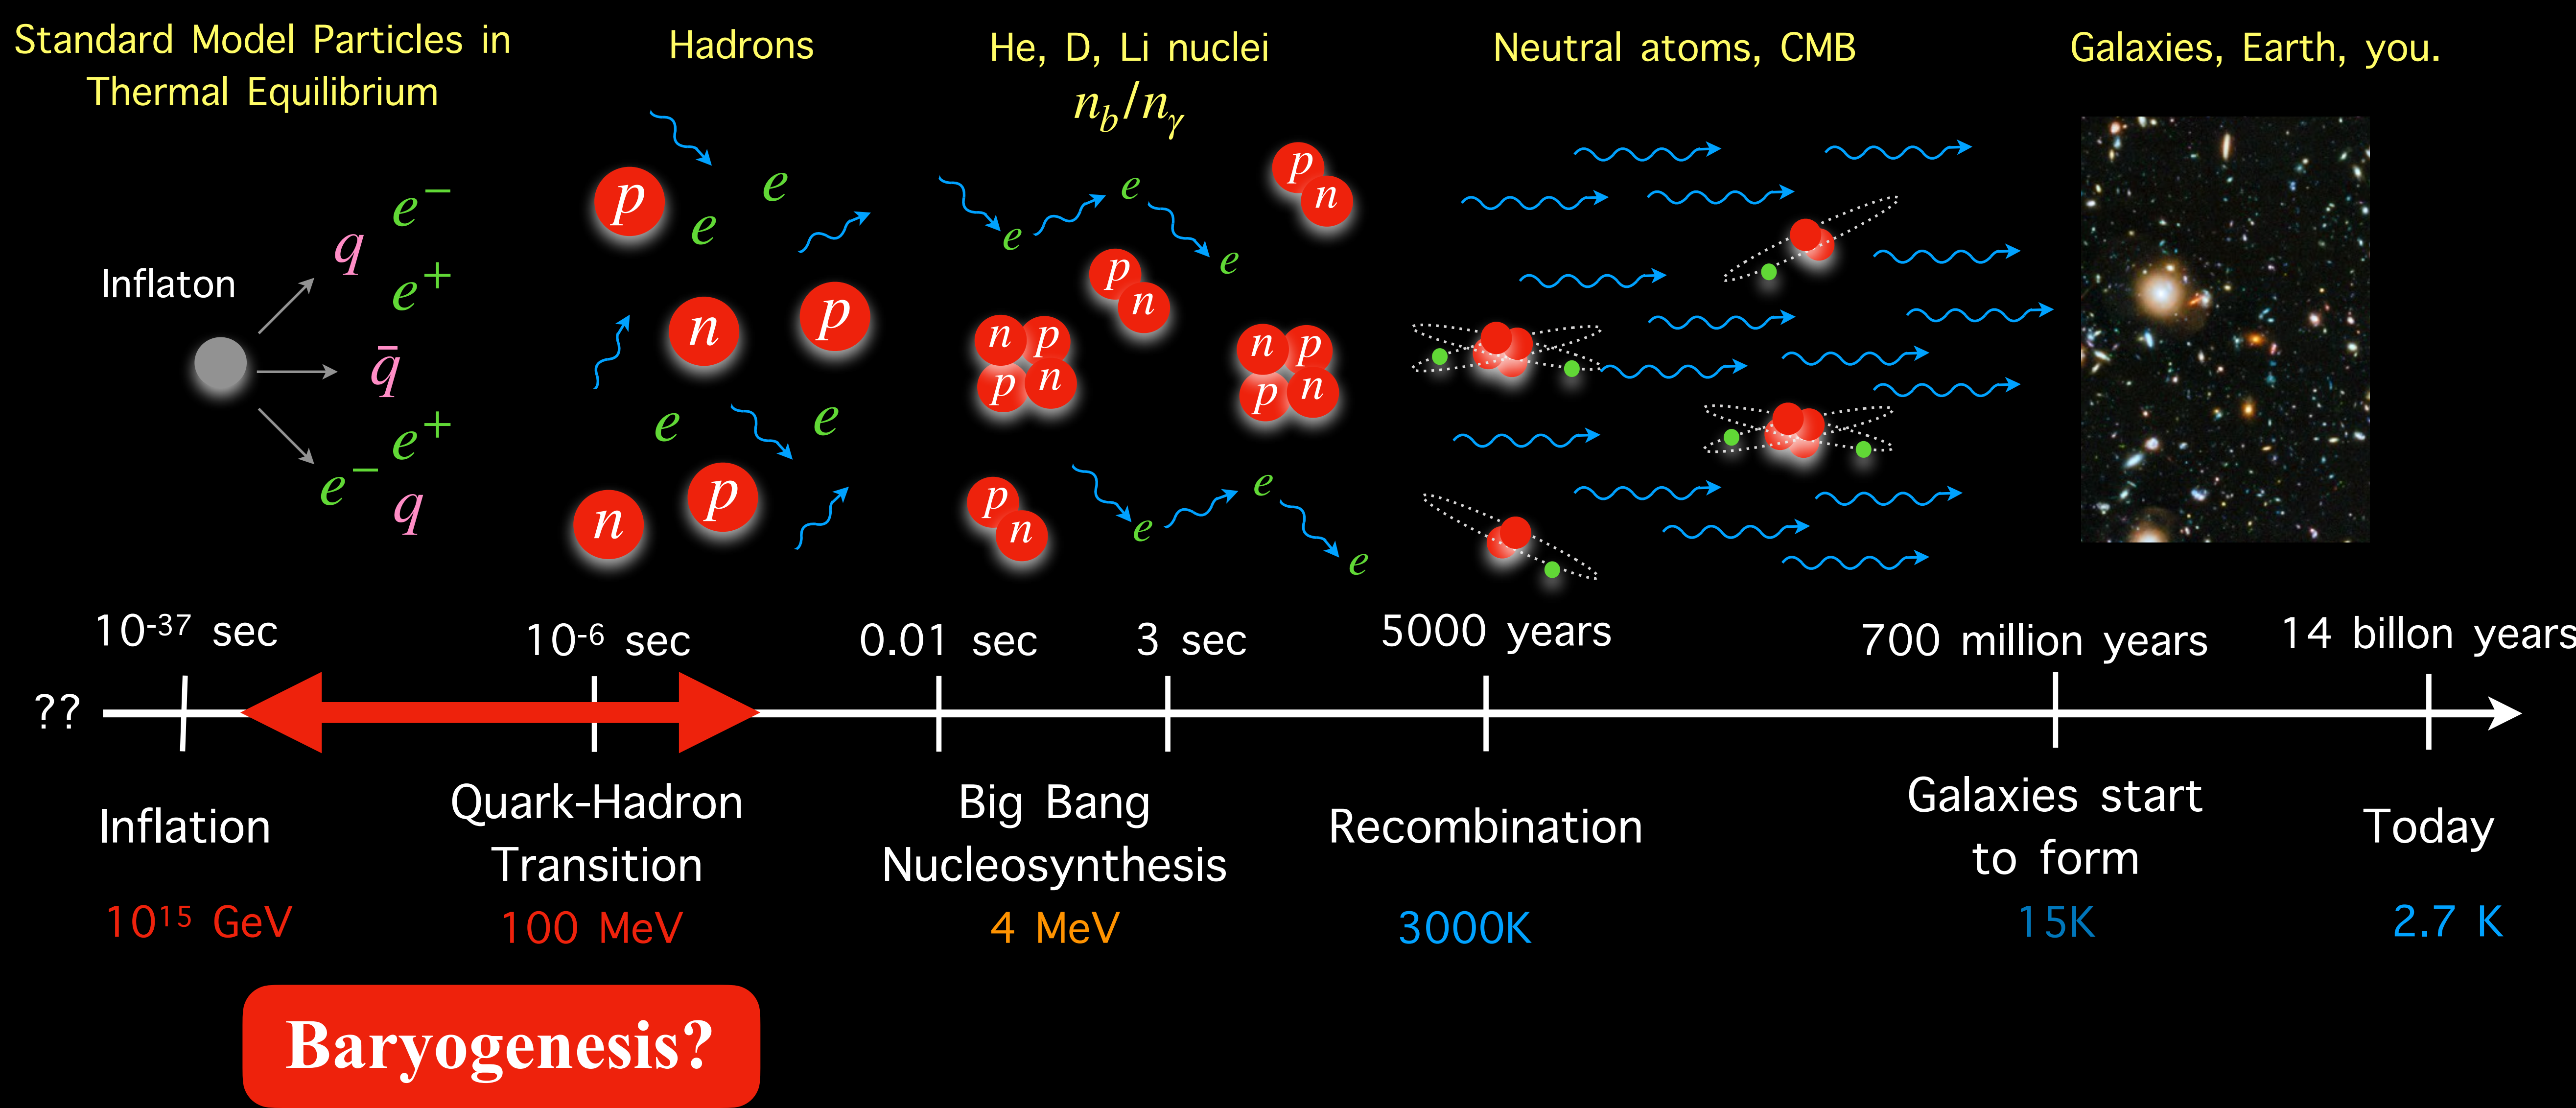
What is the nature and origin of dark matter?

Energy density today

We don't know where the 5 % of baryonic matter came from.

G. Elor

The History of the Universe



What mechanism generated the initial asymmetry? Observed to be (BBN, CMB):

$$Y_B^{obs} \equiv \frac{n_{\mathcal{B}} - n_{\bar{\mathcal{B}}}}{s} \sim 8 \times 10^{-11}$$

Baryogenesis

Review: how to generate a baryon asymmetry?

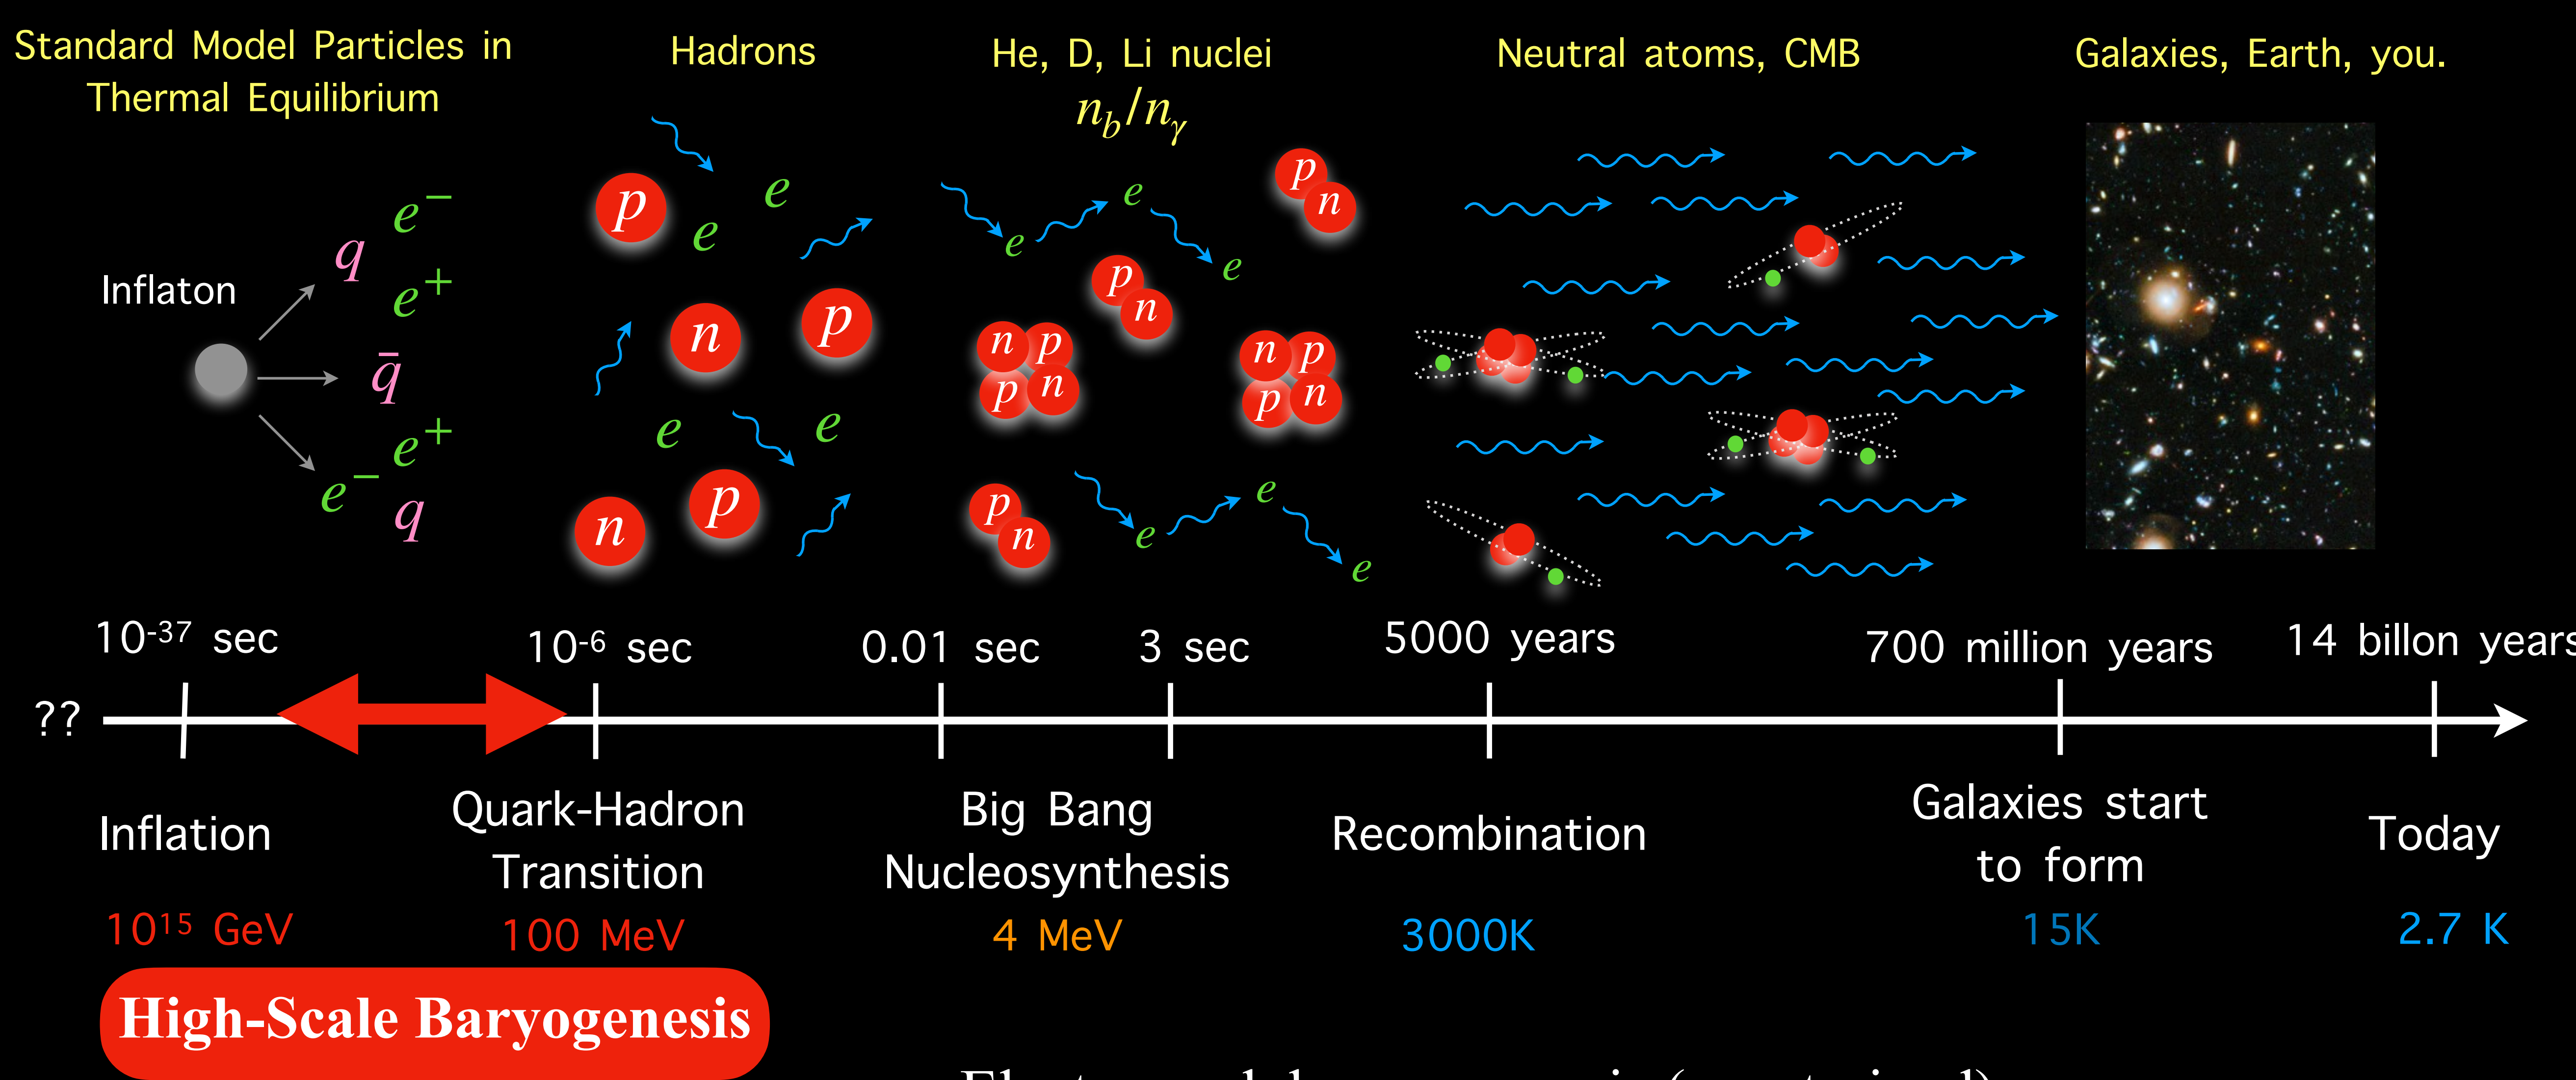
Observation: $$\boxed{Y_B^{obs} \equiv \frac{n_{\mathcal{B}} - n_{\bar{\mathcal{B}}}}{s} = (8.718 \pm 0.004) \times 10^{-11}}$$

The Sakharov conditions:

- Baryon number violation.
- Conjugate rates must be different.
- Out of thermal equilibrium.

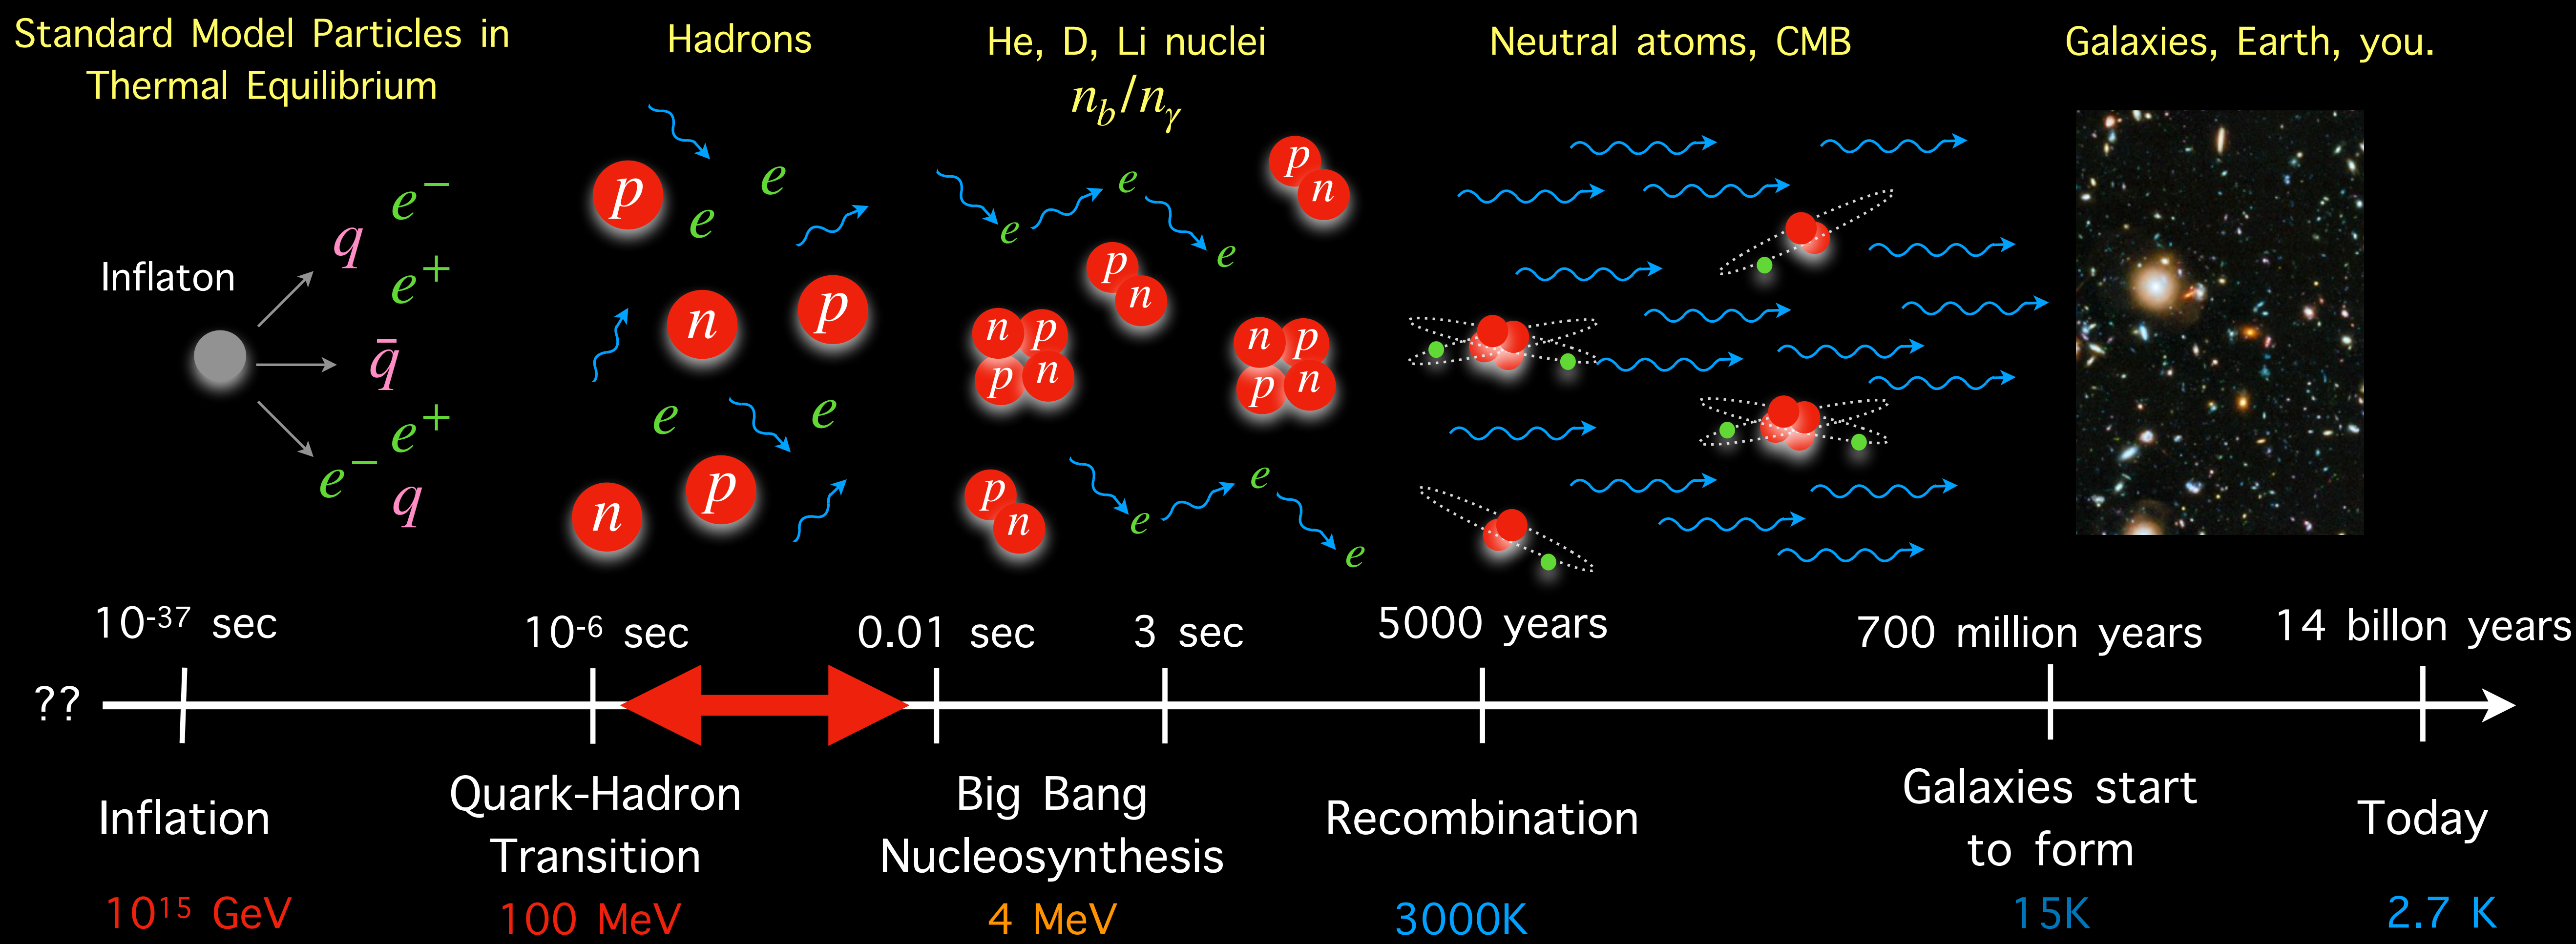
G. Elor

"Traditional" Baryogenesis



- Electroweak baryogengesis (constrained)
- Leptogenesis (hard to test)
- Affleck-Dine (very hard to test)
- ……

Making the Universe at 20MeV



Mesogenesis:
baryon asymmetry + dark matter

GE with Robert McGehee, Phys.Rev.D [2011.06115]

GE with Miguel Escudero and Ann Nelson, Phys.Rev.D [1810.00880]

- Controlled by experimental observables. Signals!
- Theoretically appealing e.g. Relaxion and Nnaturalness require low scale baryogenesis.

Mesogenesis

Baryogenesis and Dark Matter production using the CP Violation
of Standard Model Meson Systems

Observation: $\boxed{Y_B^{\mathrm{obs}} = (8.718 \pm 0.004) \times 10^{-11}}$

The Sakharov conditions:

- Out of thermal equilibrium:
- CP Violation:
- "Baryon number violation":

Mesogenesis

Baryogenesis and Dark Matter production using the CP Violation
of Standard Model Meson Systems

Observation: $\boxed{Y_B^{\rm obs} = (8.718 \pm 0.004) \times 10^{-11}}$

The Sakharov conditions:

- Out of thermal equilibrium: Late decays of “inflaton” field to SM Mesons.
- CP Violation:
- “Baryon number violation”:

G. Elor

Today's Talk

Baryogenesis and Dark Matter production using the CP Violation of Standard Model Meson Systems

Observation: $\boxed{Y_B^{\mathrm{obs}} = (8.718 \pm 0.004) \times 10^{-11}}$

- Part I. *B*-Mesogenesis: CP violation from neutral B meson oscillations [GE with Miguel Escudero and Ann Nelson arXiv:1810.00880].
- Part II. Discovering *B*-Mesogenesis: Details of signals and searches [GE with Gonzalo Alonso-Alvarez and Miguel Escudero arXiv:2101.02706, ongoing work, both theory and experimental].
- Part III. *D*-Mesogenesis: CP violation from charged *D* meson decays [GE with Robert McGehee arXiv:2011.06115].

Part I.
B-Mesogenesis

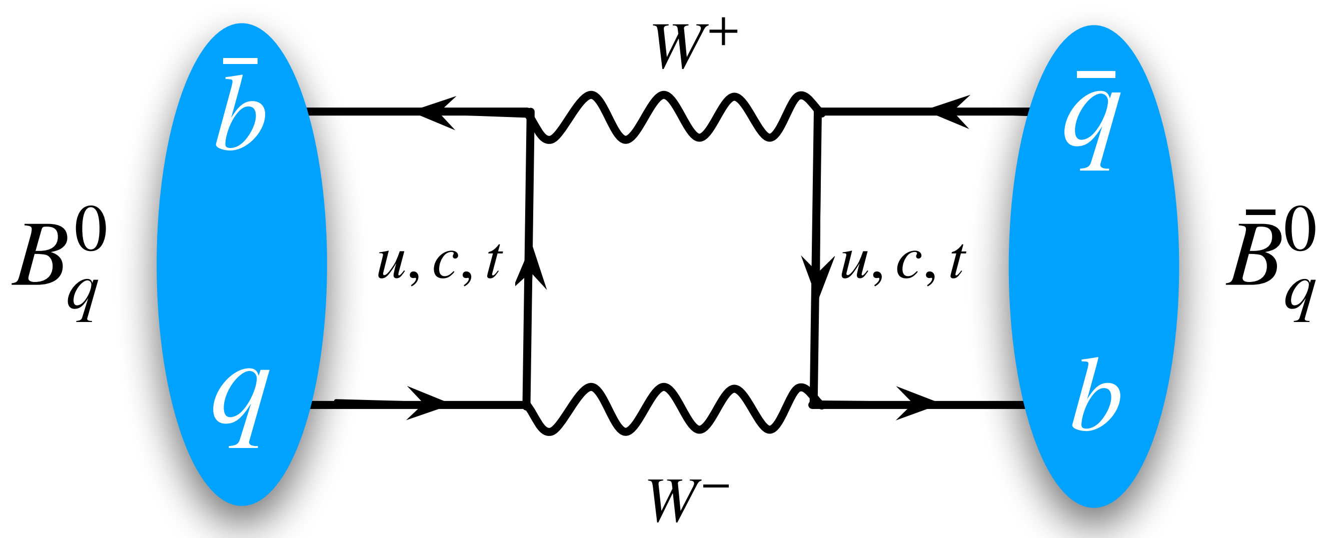
B_d^0 B_s^0

Based on:

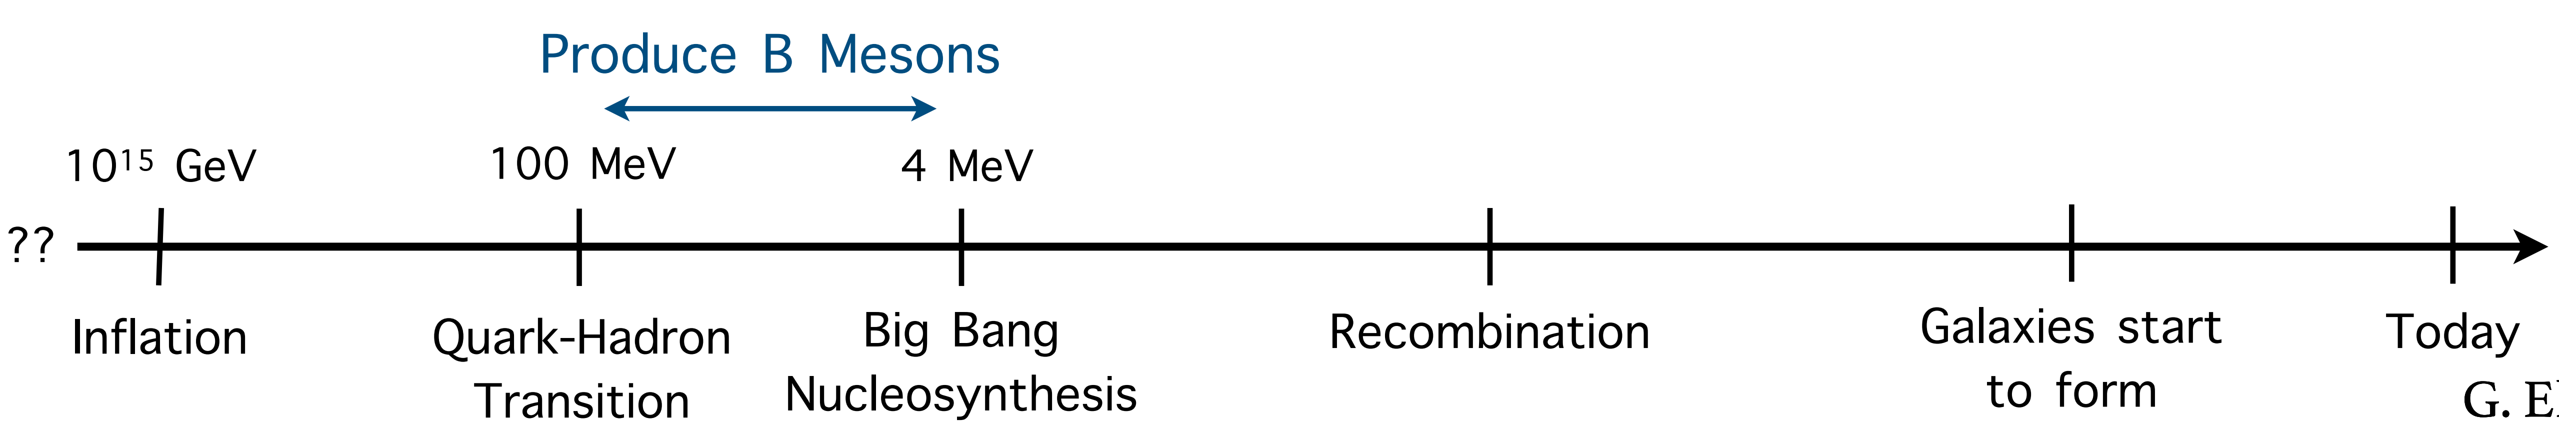
[GE with Miguel Escudero and Ann Nelson, Phys. Rev. D, arXiv:1810.00880]
[GE with Gonzalo Alonso-Alvarez, Ann Nelson and Huangyu Xiao, JHEP, arXiv:1907.10612]

Neutral B Meson Oscillations

At low energies we can use CPV in B meson mixing
e.g. from CKM phases in the case of the Standard Model
(but new physics contributions are also not excluded)



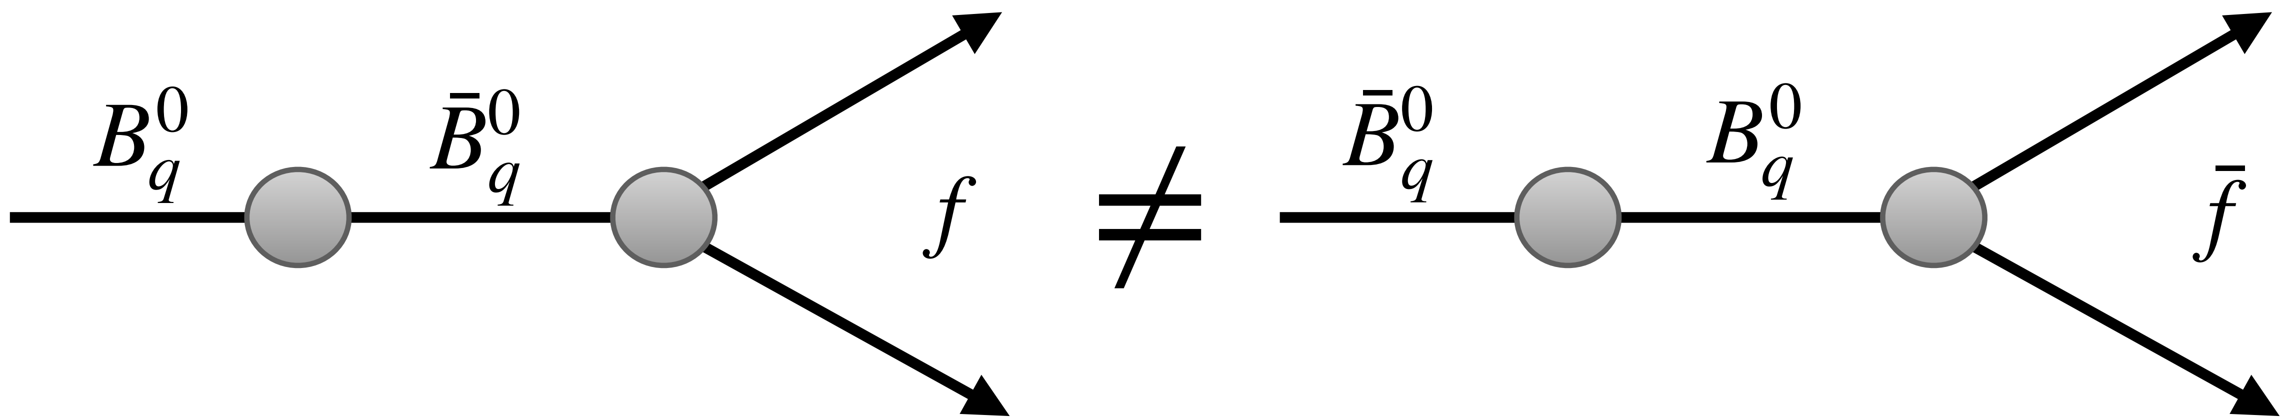
$$\propto \quad (V_{tb} V_{tq}^*)^2$$



G. Elor

CP Violation

B meson/anti-meson mixing has sizable CP violation



Need: $\Gamma\left(\bar{B}^0 \to B^0 \to f\right) - \Gamma\left(B^0 \to \bar{B}^0 \to \bar{f}\right) > 0$

Observable: $$A^q_{\mathrm{SL}} = \frac{\Gamma\left(\bar{B}^0_q \to B^0_q \to f\right) - \Gamma\left(B^0_q \to \bar{B}^0_q \to \bar{f}\right)}{\Gamma\left(\bar{B}^0_q \to B^0_q \to f\right) + \Gamma\left(B^0_q \to \bar{B}^0_q \to \bar{f}\right)}$$

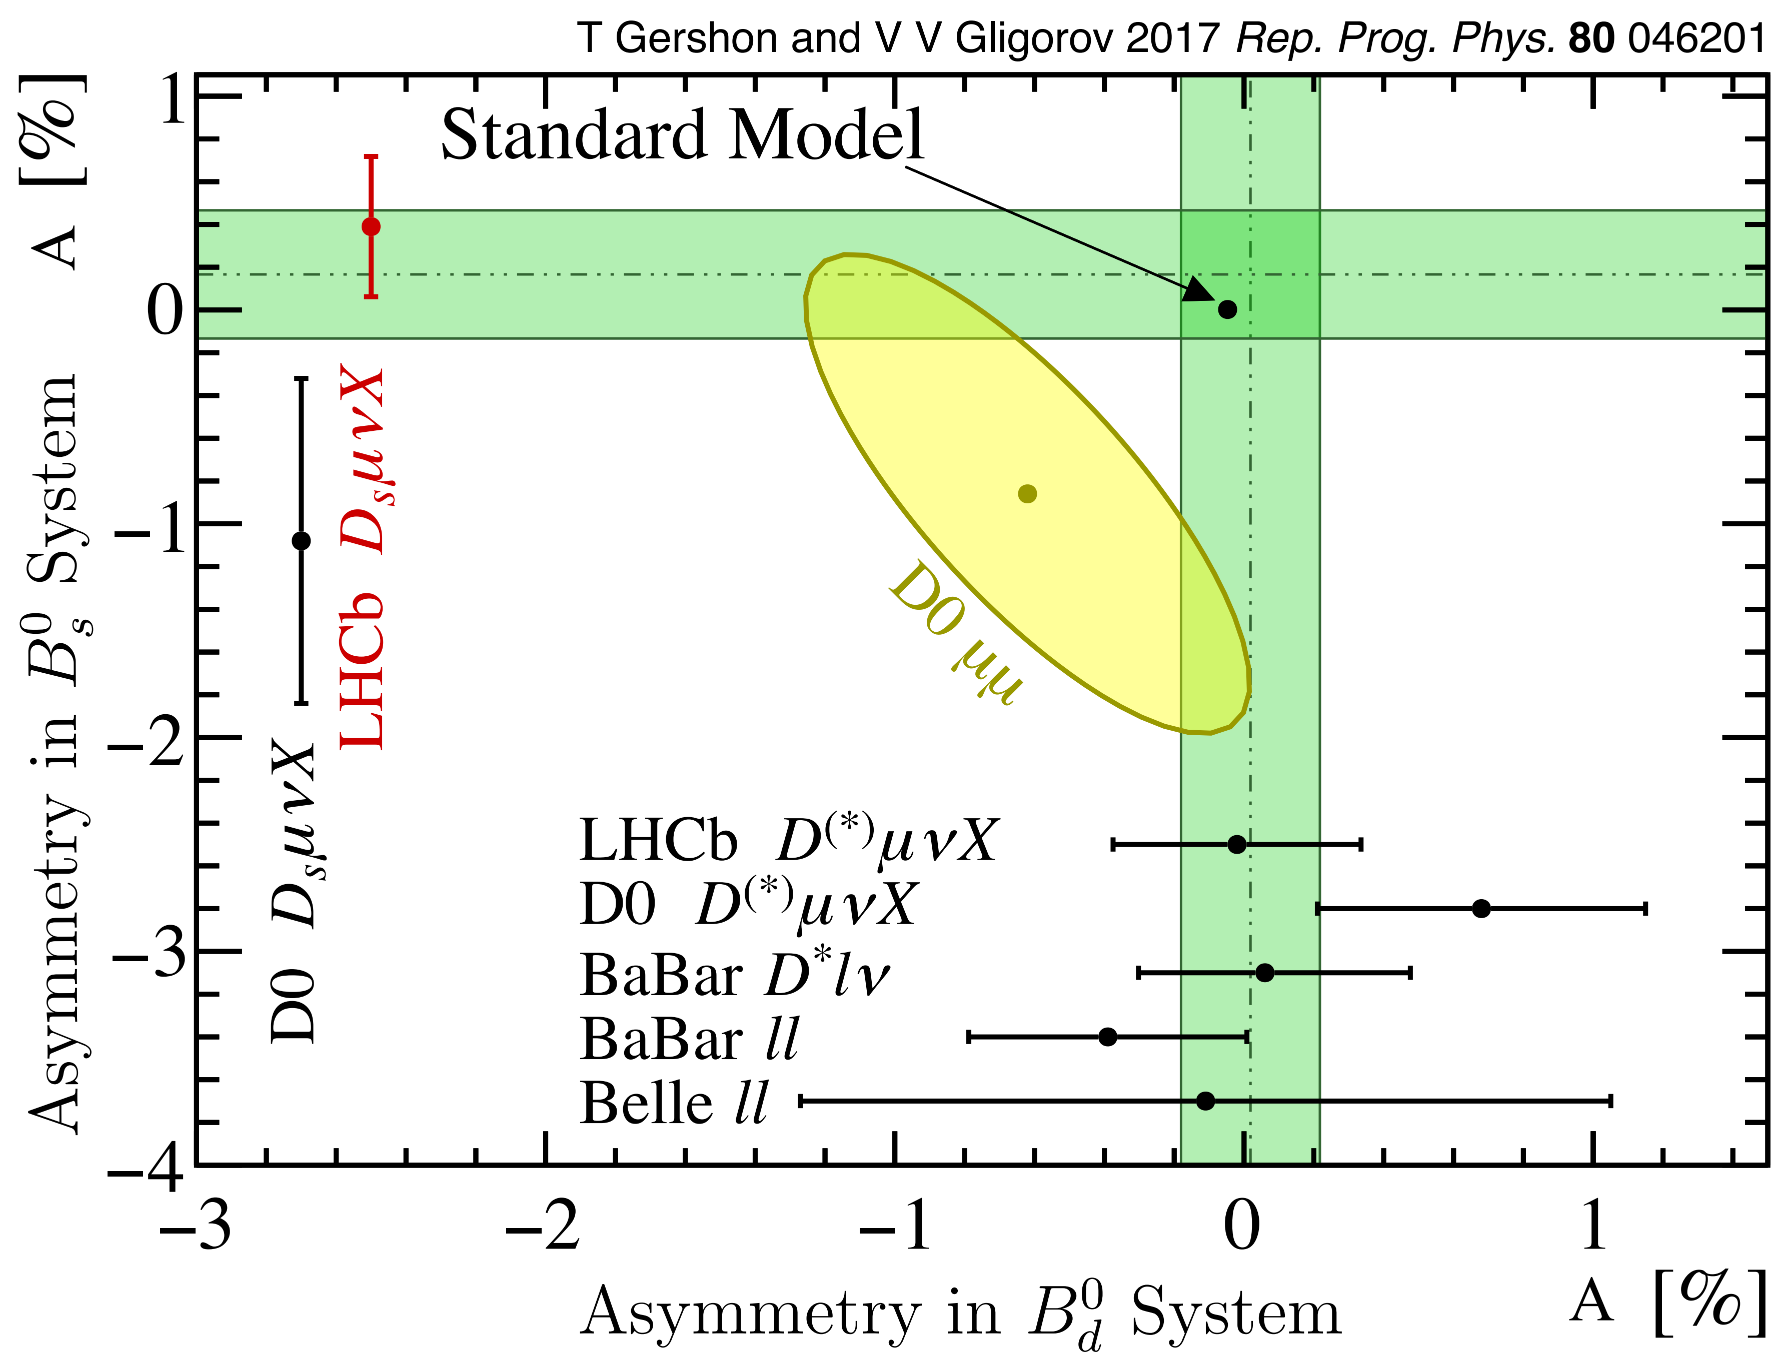
Standard Model: $A^d_{\mathrm{SL}}|_{\mathrm{SM}} = (-4.7 \pm 0.4) \times 10^{-4}$ Lenz, Tetlalmatzi-Xolocotzi [1912.07621]

$A^s_{\mathrm{SL}}|_{\mathrm{SM}} = (2.1 \pm 0.2) \times 10^{-5}$

G. Elor

Asymmetry in *B* Meson Mixing

Can accommodate contributions from new physics

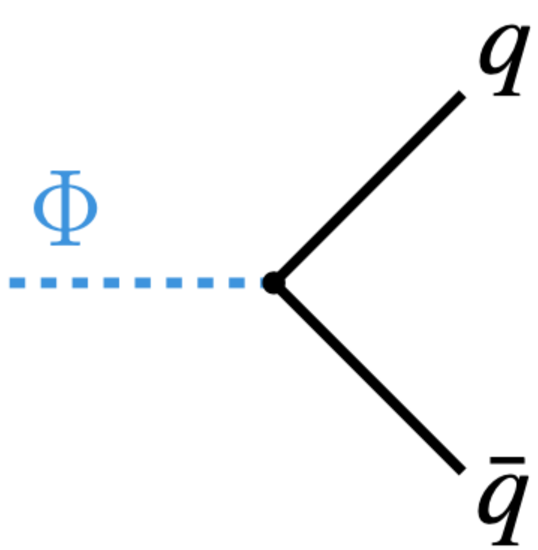


G. Elor

Sakharov I. Out of Equilibrium

Late decay of an "inflaton-like" field

Decays at: $\Gamma_\Phi = 4H(T_R)$ to quarks $m_\Phi \in [5\,\mathrm{GeV}\,,\ 100\,\mathrm{GeV}]$



$$\boxed{3.5\,\mathrm{MeV} \lesssim T_\mathrm{R} \lesssim 100\,\mathrm{MeV}} \quad \tau_\Phi = \mathcal{O}(10^{-3}\,\mathrm{s})$$

Before BBN

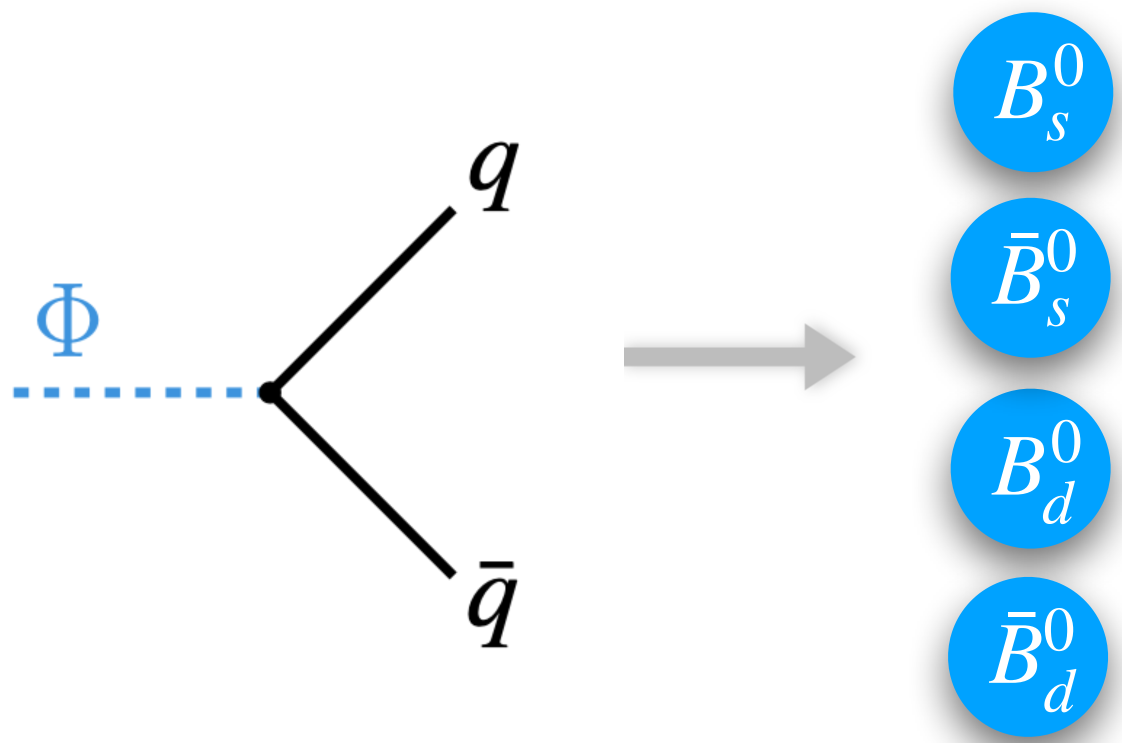
After QCD phase transition

G. Elor

Sakharov I. Out of Equilibrium

Late decay of an "inflaton-like" field

Decays at: $\Gamma_\Phi = 4H\,(T_R)$ to quarks $m_\Phi \in [5\,\mathrm{GeV}\,,\ 100\,\mathrm{GeV}]$



$$\boxed{3.5\,\mathrm{MeV} \lesssim T_\mathrm{R} \lesssim 100\,\mathrm{MeV}}$$

Before BBN

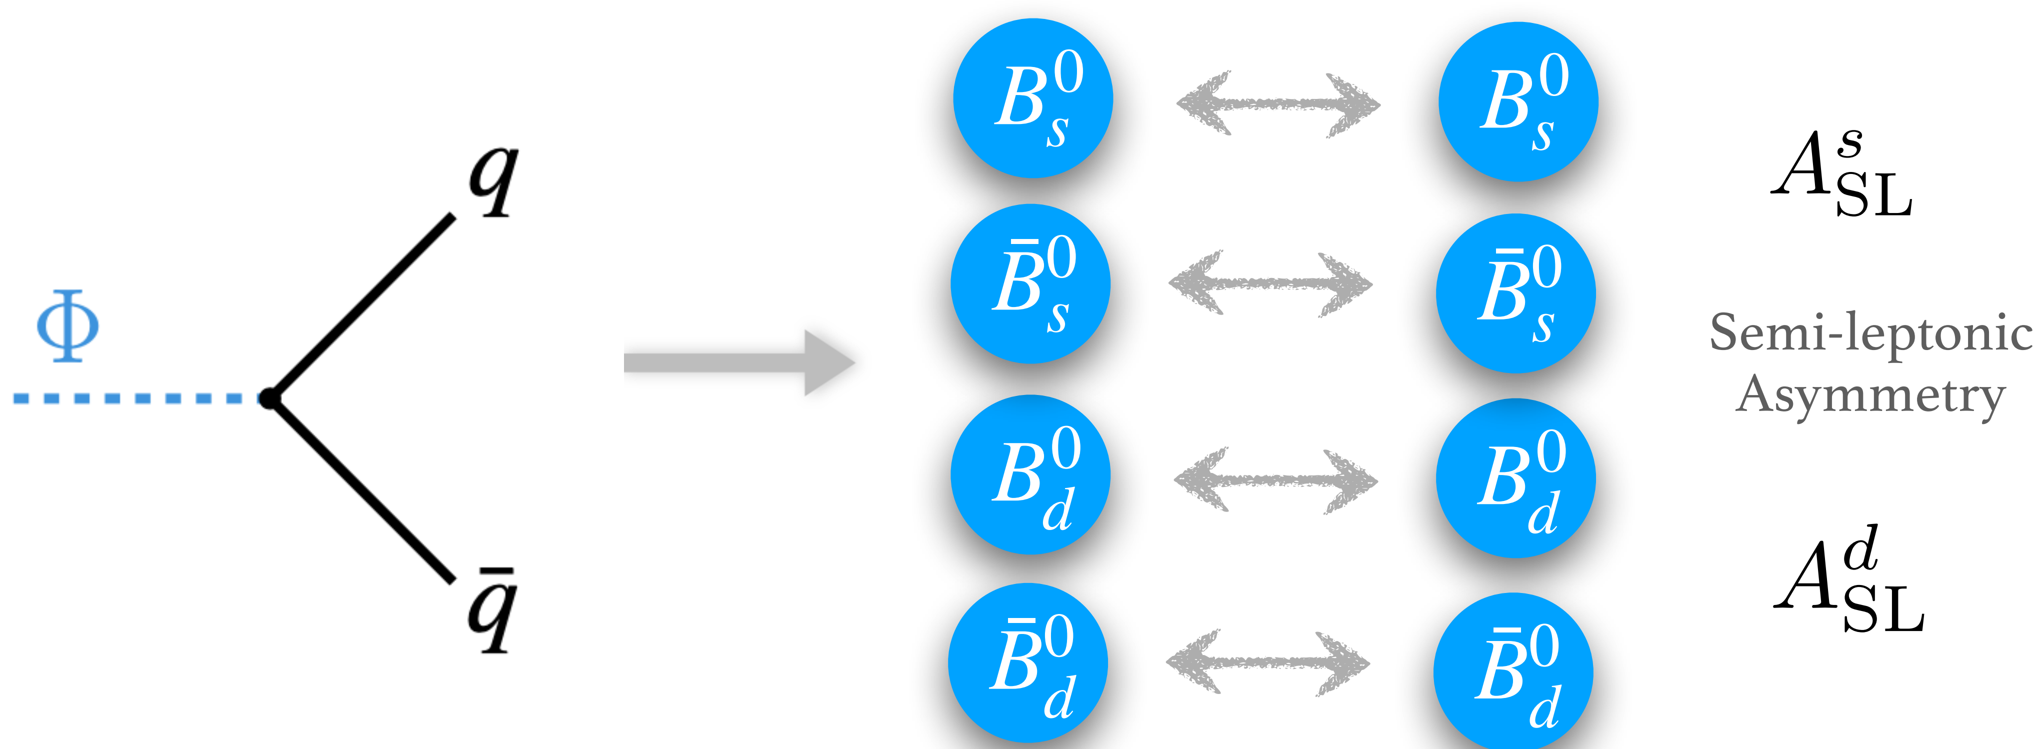
After QCD phase transition

G. Elor

Sakharov II. CP Violation

Late decay of an "inflaton-like" field

Decays at: $\Gamma_\Phi = 4H(T_R)$ to quarks $m_\Phi \in [5\,\mathrm{GeV}\,,\ 100\,\mathrm{GeV}]$



$$\boxed{3.5\,\mathrm{MeV} \lesssim T_{\mathrm{R}} \lesssim 100\,\mathrm{MeV}}$$

Before BBN

After QCD phase transition

G. Elor

Sakharov III. *B* Violation?

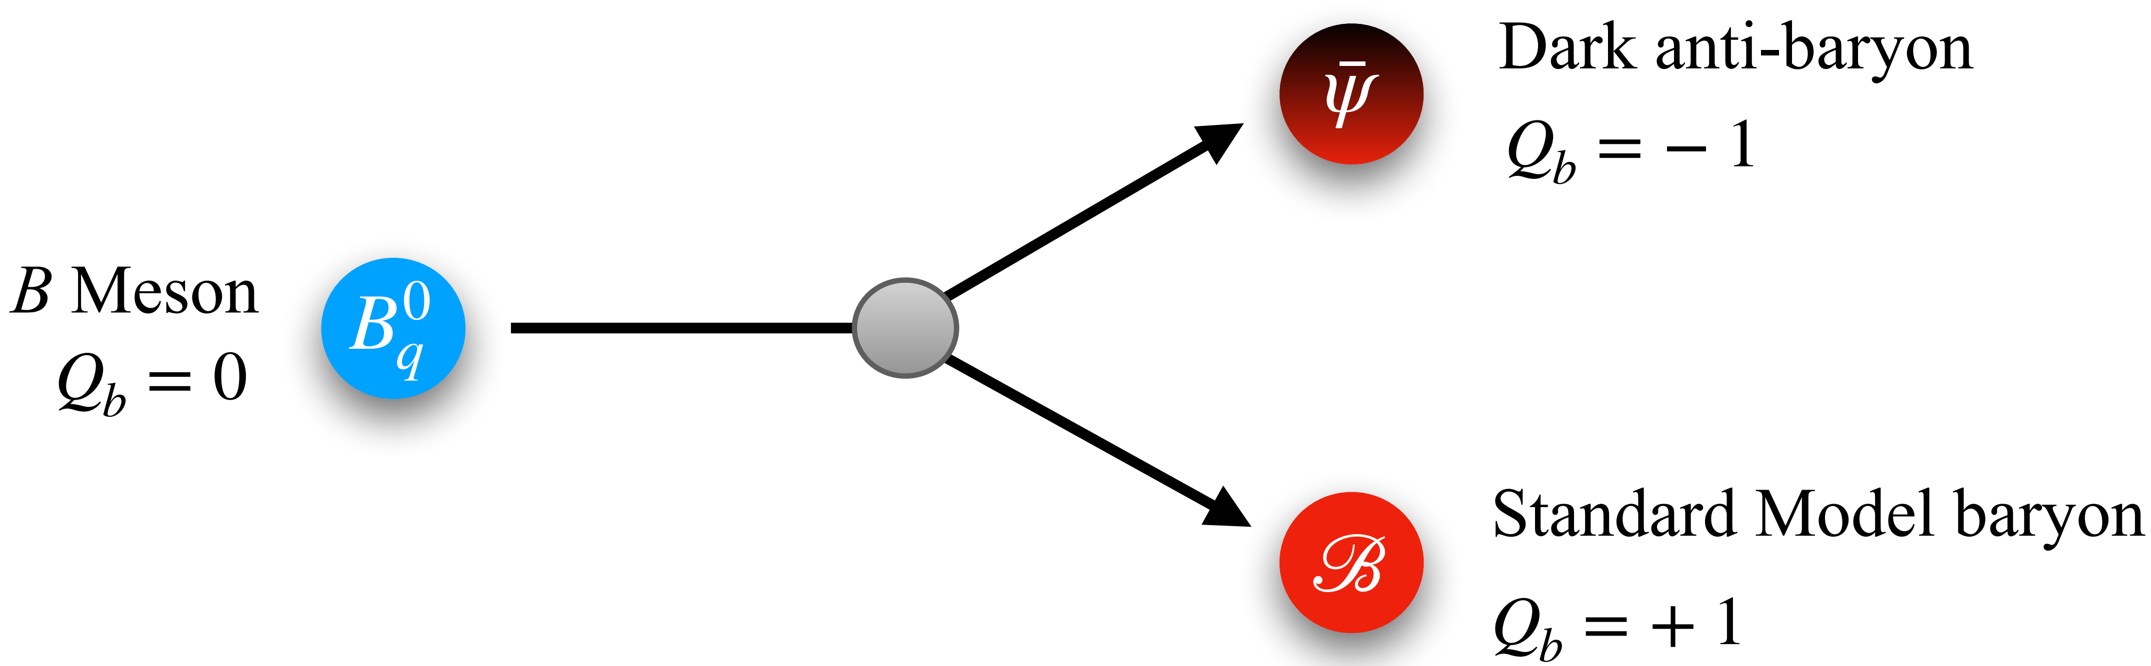
Need a way to change baryon number

Hide baryon number in a dark sector
rather than violate it

Will minimally need four new fields

Dark Sector Baryon

Hide baryon number in a dark sector



Kinematics: $m_\psi < m_B - m_{\text{Baryon}} < 4.3\,\text{GeV}$

Proton stability: $m_\psi > m_p - m_e \simeq 937.8\,\text{MeV}$

Equal and opposite dark and visible baryon asymmetries generated.

$$Y_{\mathcal{B}} - Y_{\bar{\mathcal{B}}} = -\left(Y_\psi - Y_{\bar{\psi}}\right)$$

G. Elor

Colored Triplet Scalar

Field	Spin	Q_{EM}	Baryon no.	$\mathbb{Z}_2$	Mass
Φ	0	0	0	$+1$	$11 - 100\,\mathrm{GeV}$
Y	0	$-1/3$	$-2/3$	$+1$	$\mathcal{O}(\mathrm{TeV})$
ψ	$1/2$	0	-1	$+1$	$\mathcal{O}(\mathrm{GeV})$

Allowed by all the symmetries: $\boxed{\mathcal{L} \supset -y_{ub}\, Y^*\, \bar{u}\, b^c - y_{\psi s}\, Y \bar{\psi}\, s^c + \text{h.c}}$

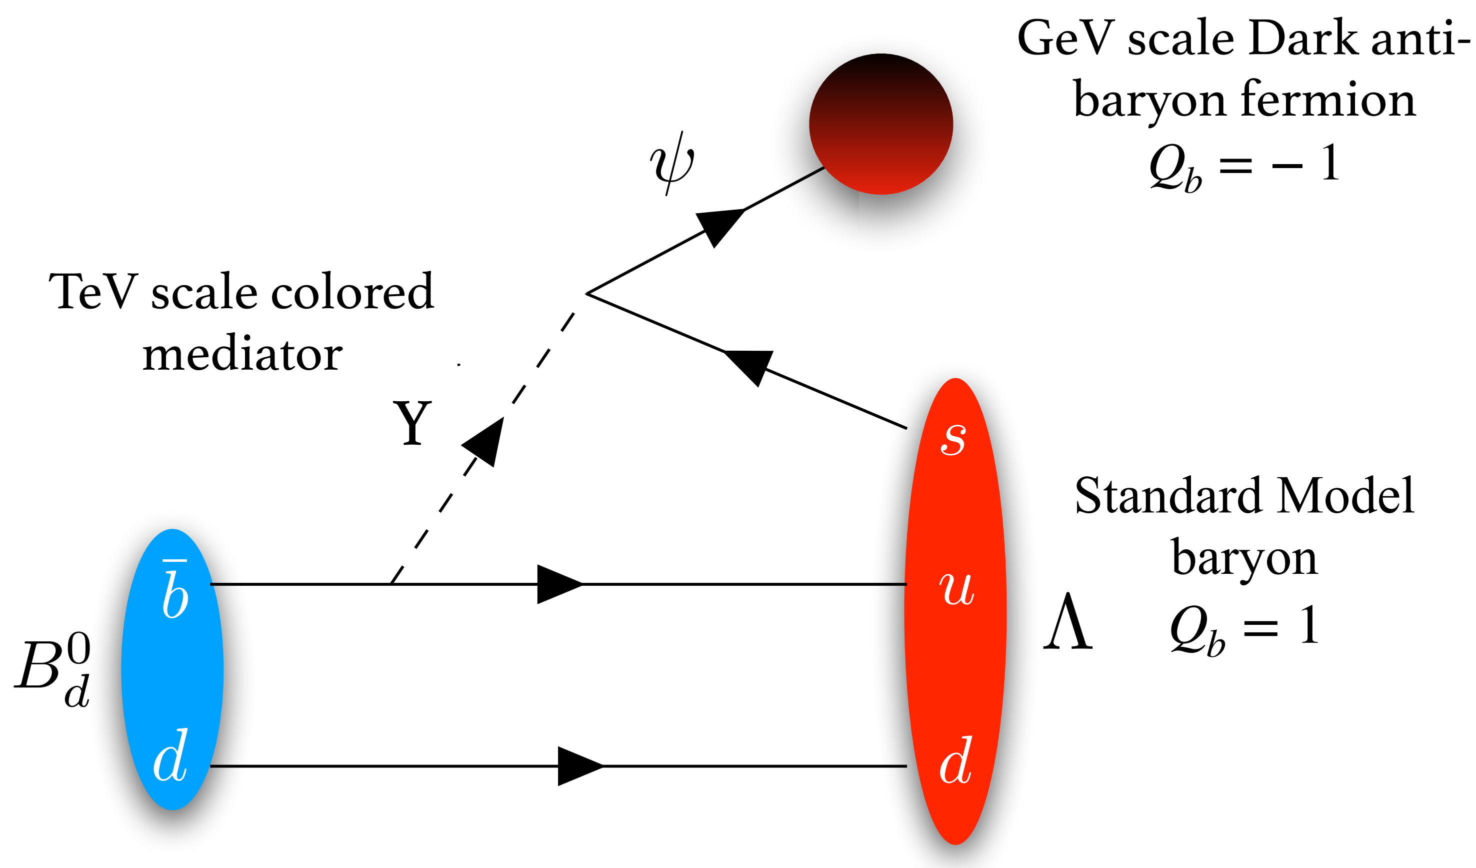
Colored triplet scalar must be TeV scale to be consistent with collider searches, so we will integrate it out:

$$\boxed{\mathcal{H}_{eff} = \frac{\kappa}{m_Y^2} b\, u\, s\, \psi}$$

Note: this interaction *does not* change baryon number

New decay of the B Meson

For instance, $\mathcal{O}_{us} = \psi\, b\, u\, s$ mediates the decay $\bar{b} \to \psi + u + s$

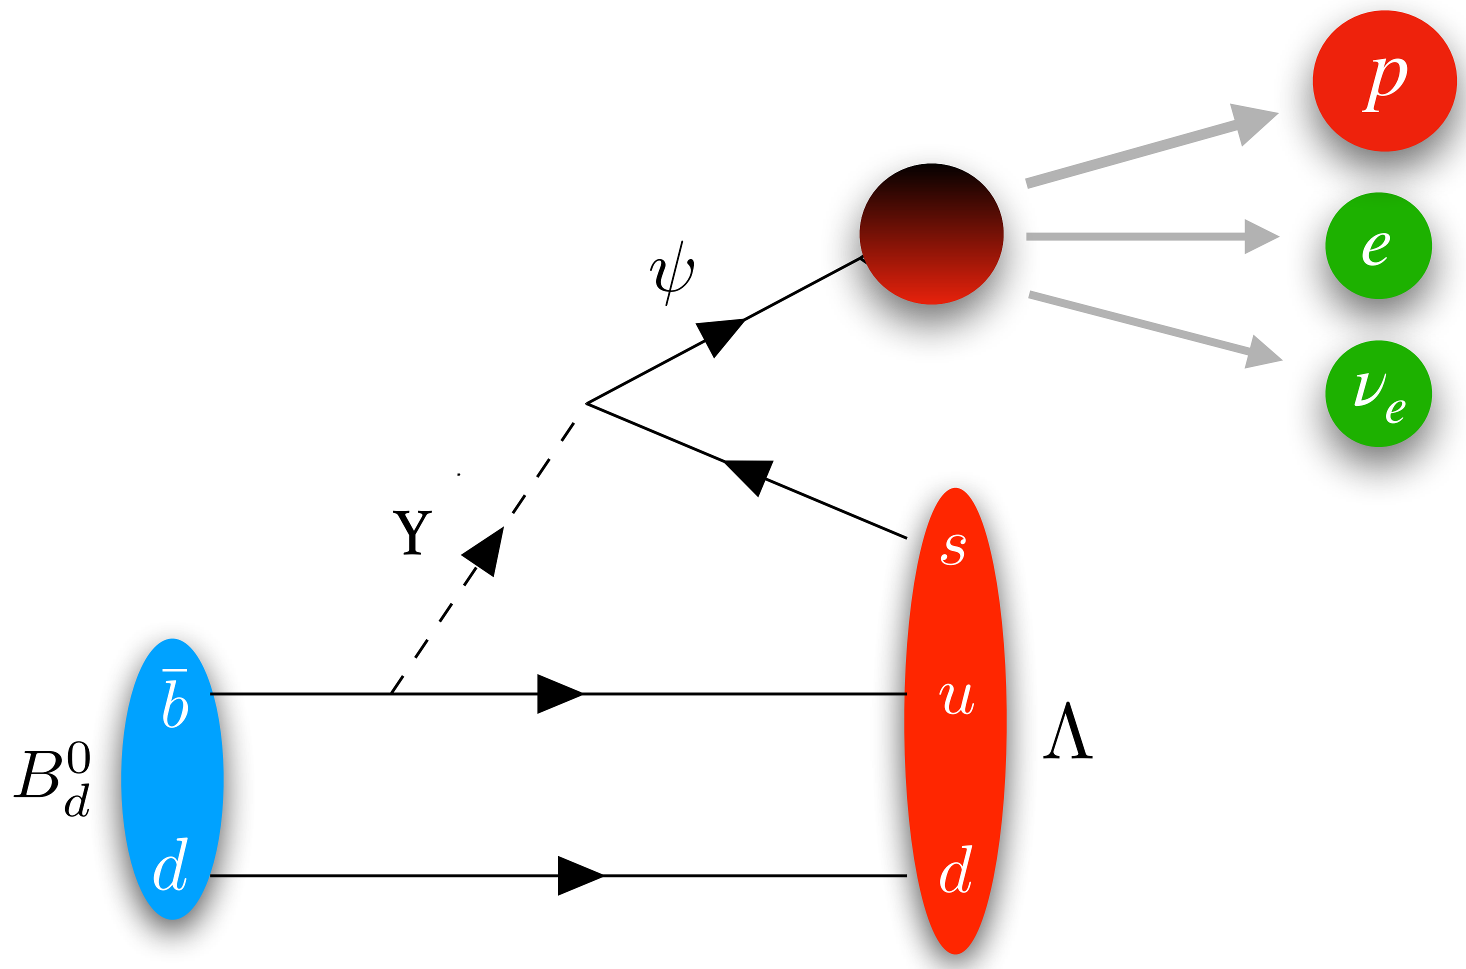


Decay modes of a B meson to baryon and missing energy have historically not been searched for. Relatively unconstrained.

G. Elor

Dark Matter

Recall: $\boxed{0.94\,\mathrm{GeV} < m_\psi < 4.34\,\mathrm{GeV}}$

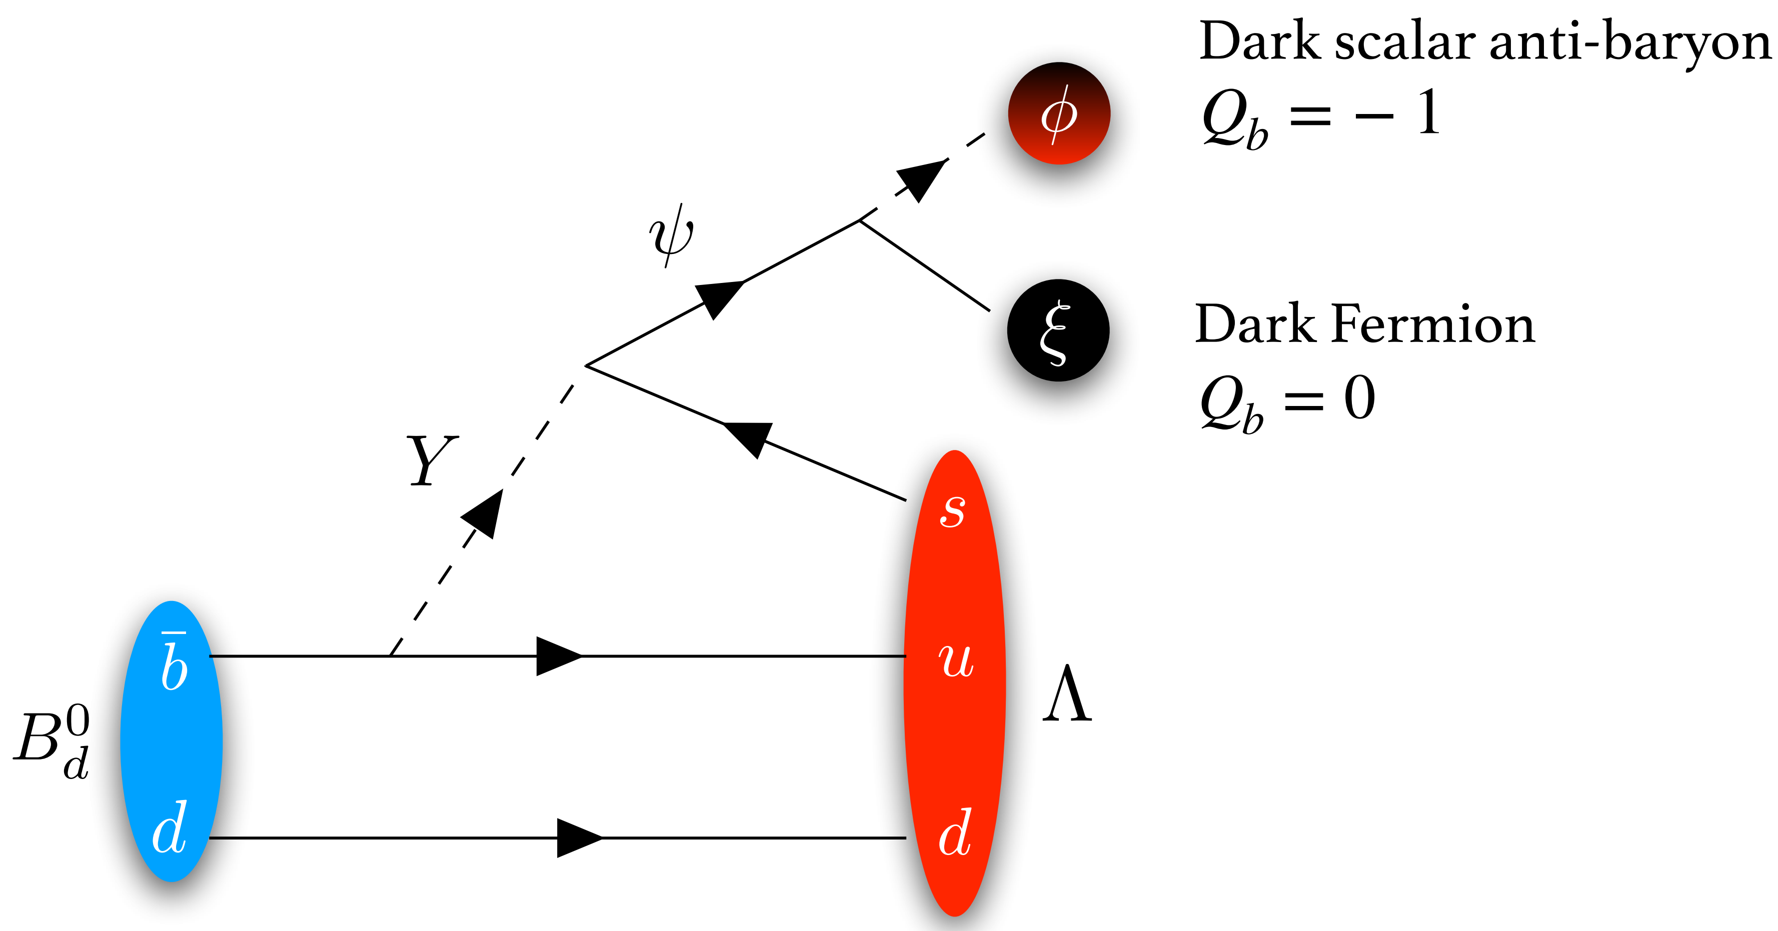


New dark baryon is unstable and will decay to baryonic matter, washing out the asymmetry in the process. It cannot be the dark matter.

G. Elor

Dark Matter

Dark fermion must quickly decay within the dark sector into two new dark sector fields

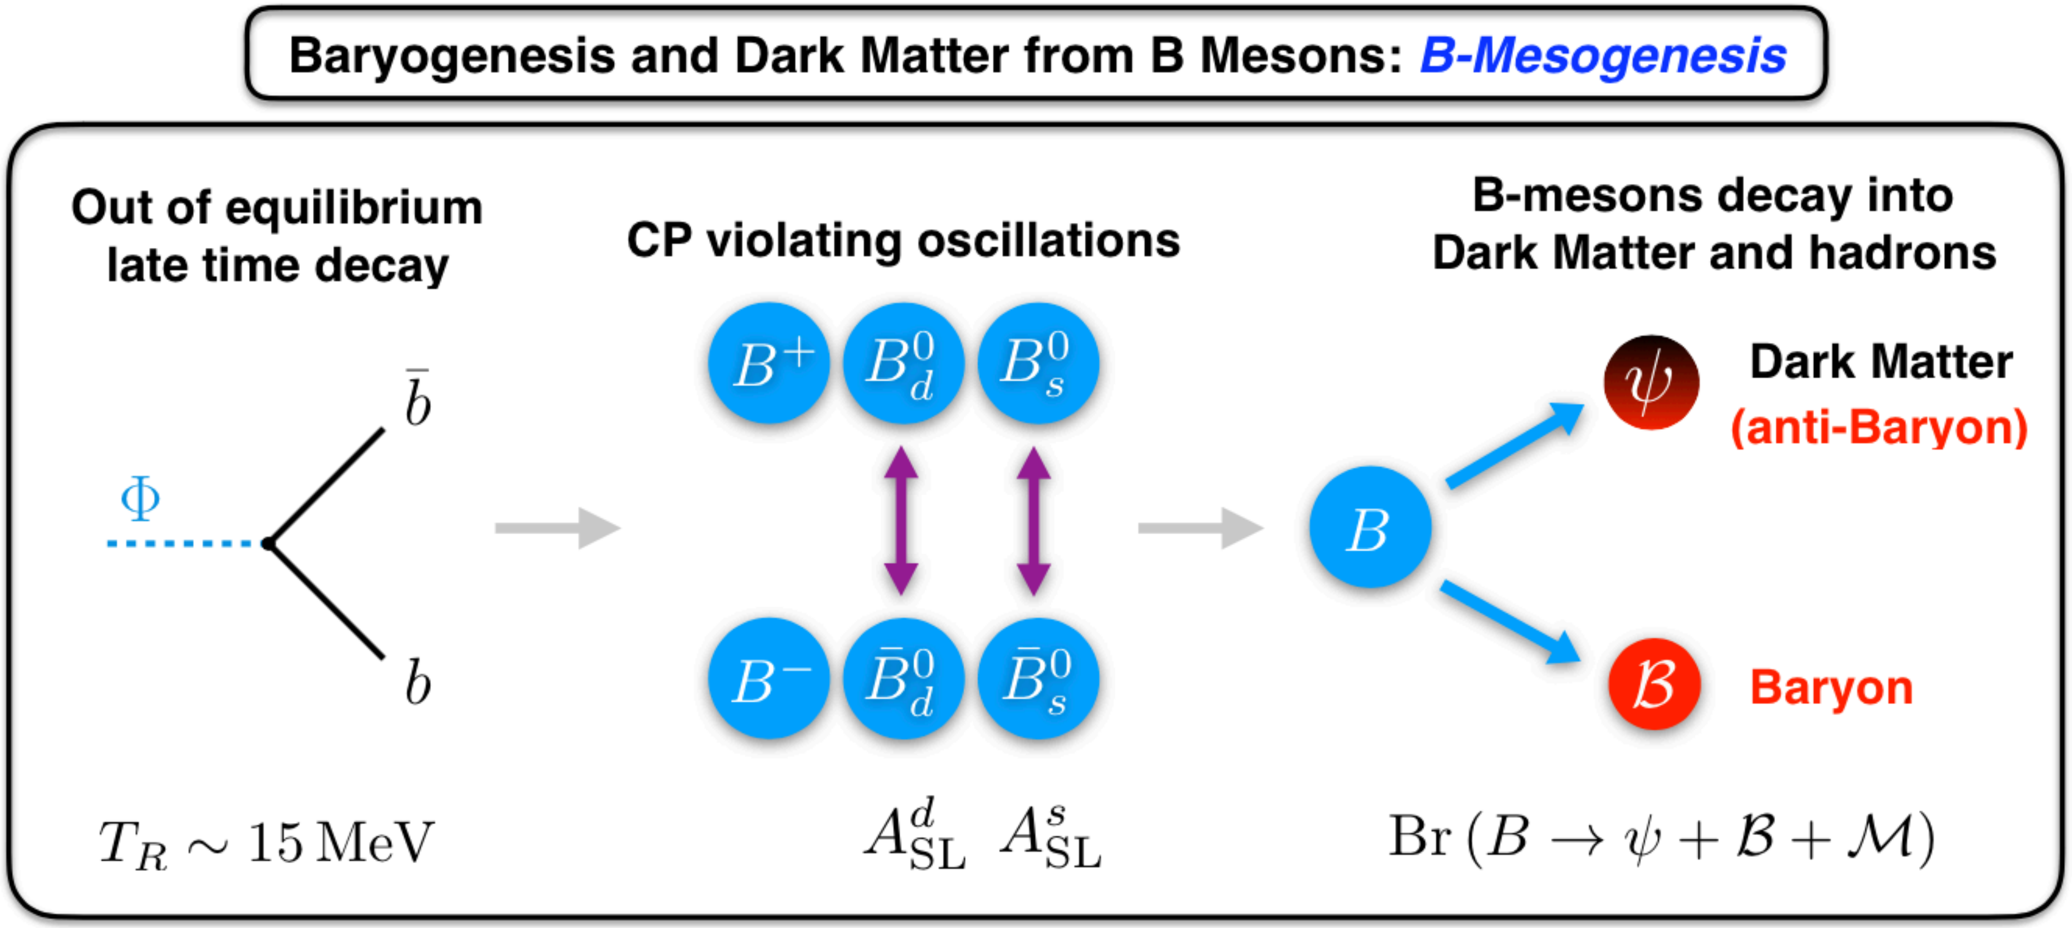


DM stability/asymmetry preserved if : $\boxed{m_\phi < m_p + m_e + m_\xi}$

Generated asymmetry: $\boxed{Y_{\mathcal{B}} - Y_{\bar{\mathcal{B}}} = -(Y_\phi - Y_{\phi^\star})}$

G. Elor

Summary: The Mechanism



Baryon asymmetry is related to experimental observables:

- Branching fraction for inclusive decay of B mesons into baryons, missing energy, and any number of final state mesons.
- Semi-leptonic asymmetries $$Y_B \propto \sum_{q=s,d} A_{\mathrm{SL}}^q \times \mathrm{Br}\left(B^0 \to \psi\,\mathcal{B}\,\mathcal{M}\right)$$

G. Elor

Summary: Minimal Model

B - Mesogenesis requires the minimal field content:

	Field	Spin	Q_{EM}	Baryon no.	$\mathbb{Z}_2$	Mass
Inflaton:	Φ	0	0	0	$+1$	$11 - 100\,\text{GeV}$
Colored Triplet Scalar:	Y	0	$-1/3$	$-2/3$	$+1$	$\mathcal{O}(\text{TeV})$
Dark Dirac Baryon:	ψ	$1/2$	0	-1	$+1$	$\mathcal{O}(\text{GeV})$
Dark Fermion:	ξ	$1/2$	0	0	-1	$\mathcal{O}(\text{GeV})$
Dark Scalar Baryon:	ϕ	0	0	-1	-1	$\mathcal{O}(\text{GeV})$

Summary: Minimal Model

B - Mesogenesis requires the minimal field content:

	Field	Spin	Q_{EM}	Baryon no.	$\mathbb{Z}_2$	Mass
Inflaton:	Φ	0	0	0	$+1$	$11 - 100\,\text{GeV}$
Colored Triplet Scalar:	Y	0	$-1/3$	$-2/3$	$+1$	$\mathcal{O}(\text{TeV})$
Dark Dirac Baryon:	ψ	$1/2$	0	-1	$+1$	$\mathcal{O}(\text{GeV})$
Dark Fermion:	ξ	$1/2$	0	0	-1	$\mathcal{O}(\text{GeV})$
Dark Scalar Baryon:	ϕ	0	0	-1	-1	$\mathcal{O}(\text{GeV})$

Aside: this can be embedded in e.g. a supersymmetric theory

$Y \leftrightarrow \tilde{q}_R$ squark, $\quad \psi \leftrightarrow \begin{bmatrix} \tilde{B} \\ \lambda_s^\dagger \end{bmatrix}$ Dirac bino, $\quad \phi\,,\ \xi \leftrightarrow$ sterile neutrino multiplet

[GE with G. Alonso-Alvarez, A. E. Nelson, H. Xiao JHEP [arXiv:1907.10612]]

However, we *do not need a UV model* for numerics or general signals

Summary: Minimal Model

B - Mesogenesis requires the minimal field content:

	Field	Spin	Q_{EM}	Baryon no.	$\mathbb{Z}_2$	Mass
Inflaton:	Φ	0	0	0	$+1$	$11 - 100\,\text{GeV}$

Dark Scalar Baryon:	ϕ	0	0	-1	-1	$\mathcal{O}(\text{GeV})$

Next:

Numerically study the evolution of the Boltzmann equations describing these fields

Aside: this can be embedded in e.g. a supersymmetric theory

$Y \leftrightarrow \tilde{q}_R$ squark, $\psi \leftrightarrow \begin{bmatrix} \tilde{B} \\ \lambda_s^\dagger \end{bmatrix}$ Dirac bino, $\phi\,,\ \xi \leftrightarrow$ sterile neutrino multiplet

[GE with G. Alonso-Alvarez, A. E. Nelson, H. Xiao JHEP [arXiv:1907.10612]]

However, we *do not need a UV model* for numerics or general signals

Boltzmann Equations

Late time decay of Inflaton

$$\Gamma_\Phi \;=\; 4H\left(T_R\right)$$

- Inflaton: $$\frac{dn_\Phi}{dt} + 3Hn_\Phi = -\,\Gamma_\Phi n_\Phi$$
- Radiation: $$\frac{d\rho_{\rm rad}}{dt} + 4H\rho_{\rm rad} = +\,\Gamma_\Phi m_\Phi n_\Phi$$
- Hubble: $$H^2 = \frac{8\pi}{3M_{\rm Pl}^2}\left(\rho_{\rm rad} + m_\Phi n_\Phi\right)$$

G. Elor

Boltzmann Equations

Dark Matter

- Symmetric component of the dark scalar baryon

$$\boxed{\frac{dn_{\phi+\phi^*}}{dt} + 3\,H\,n_{\phi+\phi^*} = 2\,\Gamma^B_\Phi\,n_\Phi - 2\,\langle\sigma v\rangle_\phi\left(n^2_{\phi+\phi^*} - n^2_{\text{eq},\,\phi+\phi^*}\right)}$$

- The dark Majorana fermion

$$\boxed{\frac{dn_\xi}{dt} + 3Hn_\xi = 2\Gamma^B_\Phi n_\Phi - \langle\sigma v\rangle_\xi\left(n^2_\xi - n^2_{\text{eq},\xi}\right)}$$

Boltzmann Equations

Dark Matter

- Symmetric component of the dark scalar baryon

$$\boxed{\frac{dn_{\phi+\phi^*}}{dt} + 3\,H\,n_{\phi+\phi^*} = 2\,\Gamma_\Phi^B\,n_\Phi - 2\,\langle\sigma v\rangle_\phi\left(n_{\phi+\phi^*}^2 - n_{\text{eq},\,\phi+\phi^*}^2\right)}$$

- The dark Majorana fermion

$$\boxed{\frac{dn_\xi}{dt} + 3Hn_\xi = 2\Gamma_\Phi^B n_\Phi - \langle\sigma v\rangle_\xi\left(n_\xi^2 - n_{\text{eq},\xi}^2\right)}$$

$$\Gamma_\Phi^B \equiv \Gamma_\Phi \times \text{Br}\,(B \to \psi\,\mathcal{B}\,\mathcal{M})$$

Simplification: For the (low) temperature range of interest we can check that the B mesons decay more quickly than they annihilate

G. Elor

Boltzmann Equations

Dark Matter

- Symmetric component of the dark scalar baryon

$$\boxed{\frac{dn_{\phi+\phi^*}}{dt} + 3\,H\,n_{\phi+\phi^*} = 2\,\Gamma_\Phi^B\,n_\Phi - 2\,\langle\sigma v\rangle_\phi\left(n_{\phi+\phi^*}^2 - n_{\mathrm{eq},\,\phi+\phi^*}^2\right)}$$

Overproduced particle must be depleted
by additional dark interactions.

- The dark Majorana fermion

$$\boxed{\frac{dn_\xi}{dt} + 3Hn_\xi = 2\Gamma_\Phi^B n_\Phi - \langle\sigma v\rangle_\xi\left(n_\xi^2 - n_{\mathrm{eq},\xi}^2\right)}$$

$$\Gamma_\Phi^B \equiv \Gamma_\Phi \times \mathrm{Br}\left(B \to \psi\,\mathcal{B}\,\mathcal{M}\right)$$

Simplification: For the (low) temperature range of interest we can check that the B mesons decay more quickly than they annihilate

G. Elor

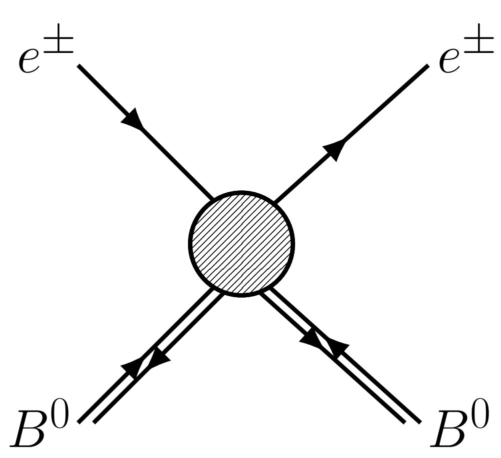
Numerics

The Baryon Asymmetry

- Anti-symmetric dark sector baryon makes up the baryon asymmetry

$$\boxed{\frac{dn_{\phi-\phi^*}}{dt} + 3Hn_{\phi-\phi^*} = 2\Gamma_\Phi^B \sum_q \mathrm{Br}\left(\bar{b} \to B_q^0\right) A_{\mathrm{SL}}^q f_{\mathrm{deco}}^q n_\Phi}$$

Coherent B meson oscillations maintained for 20 MeV scales and below



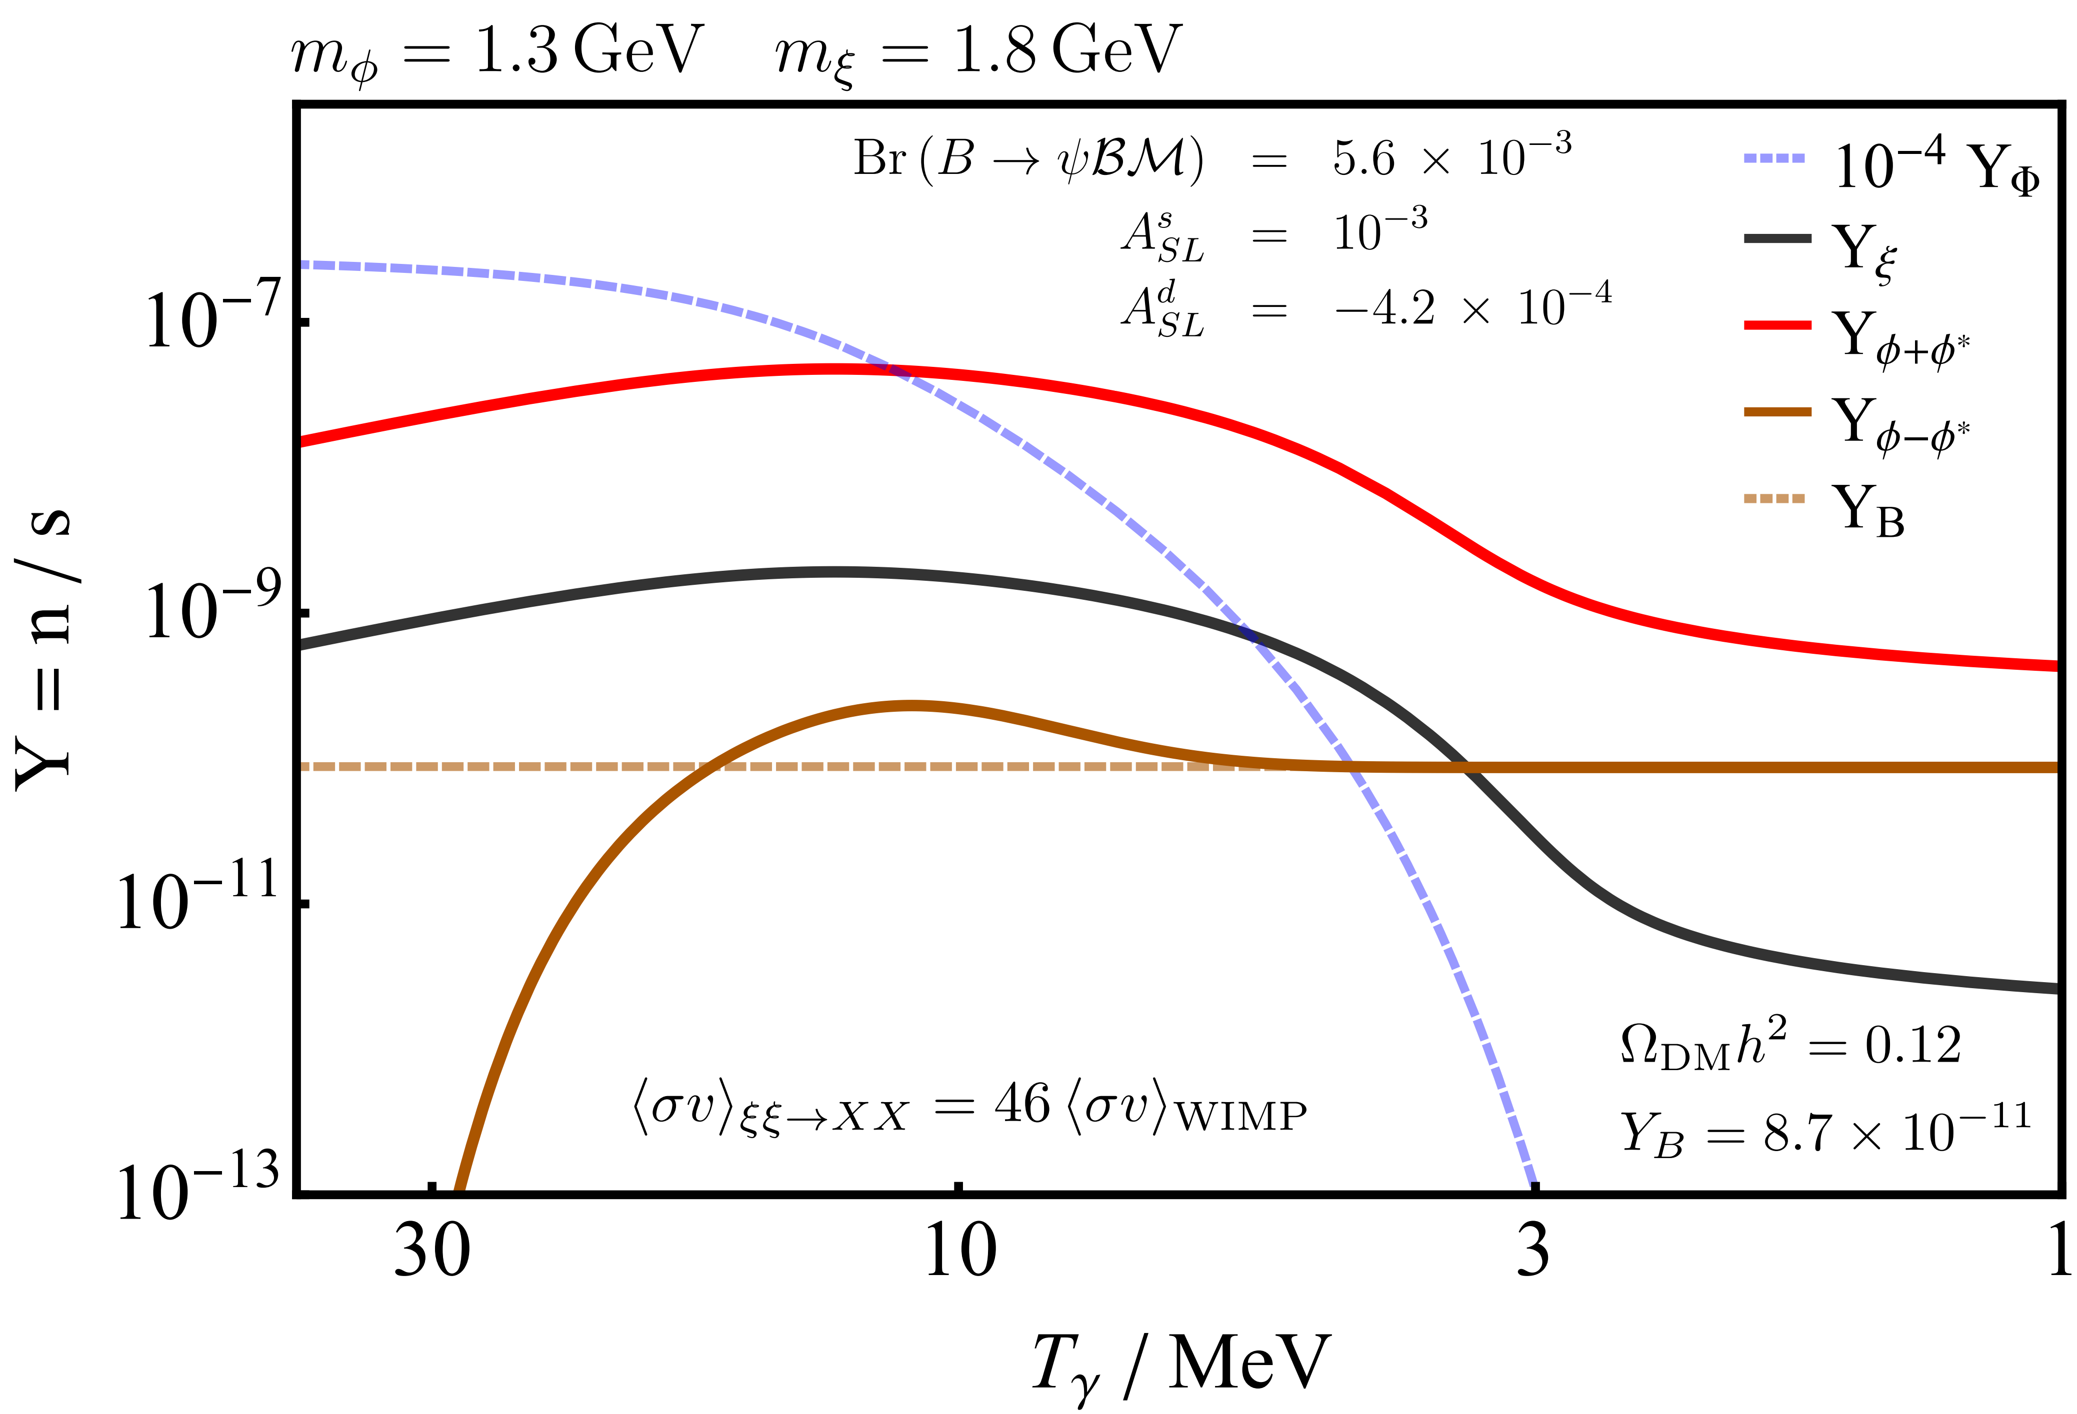
$$\Gamma\left(e^\pm B_q^0 \to e^\pm B_q^0\right) = 10^{-11}\mathrm{GeV}\left(\frac{T}{20\mathrm{MeV}}\right)^5$$

$$f_{\mathrm{deco}}^q = e^{-\Gamma\left(e^\pm B_q^0 \to e^\pm B_q^0\right)/\Delta m_{B_q}}$$

$$T_{B_s} \leq 20\,\mathrm{MeV} \text{ and } T_{B_d} \leq 10\,\mathrm{MeV}$$

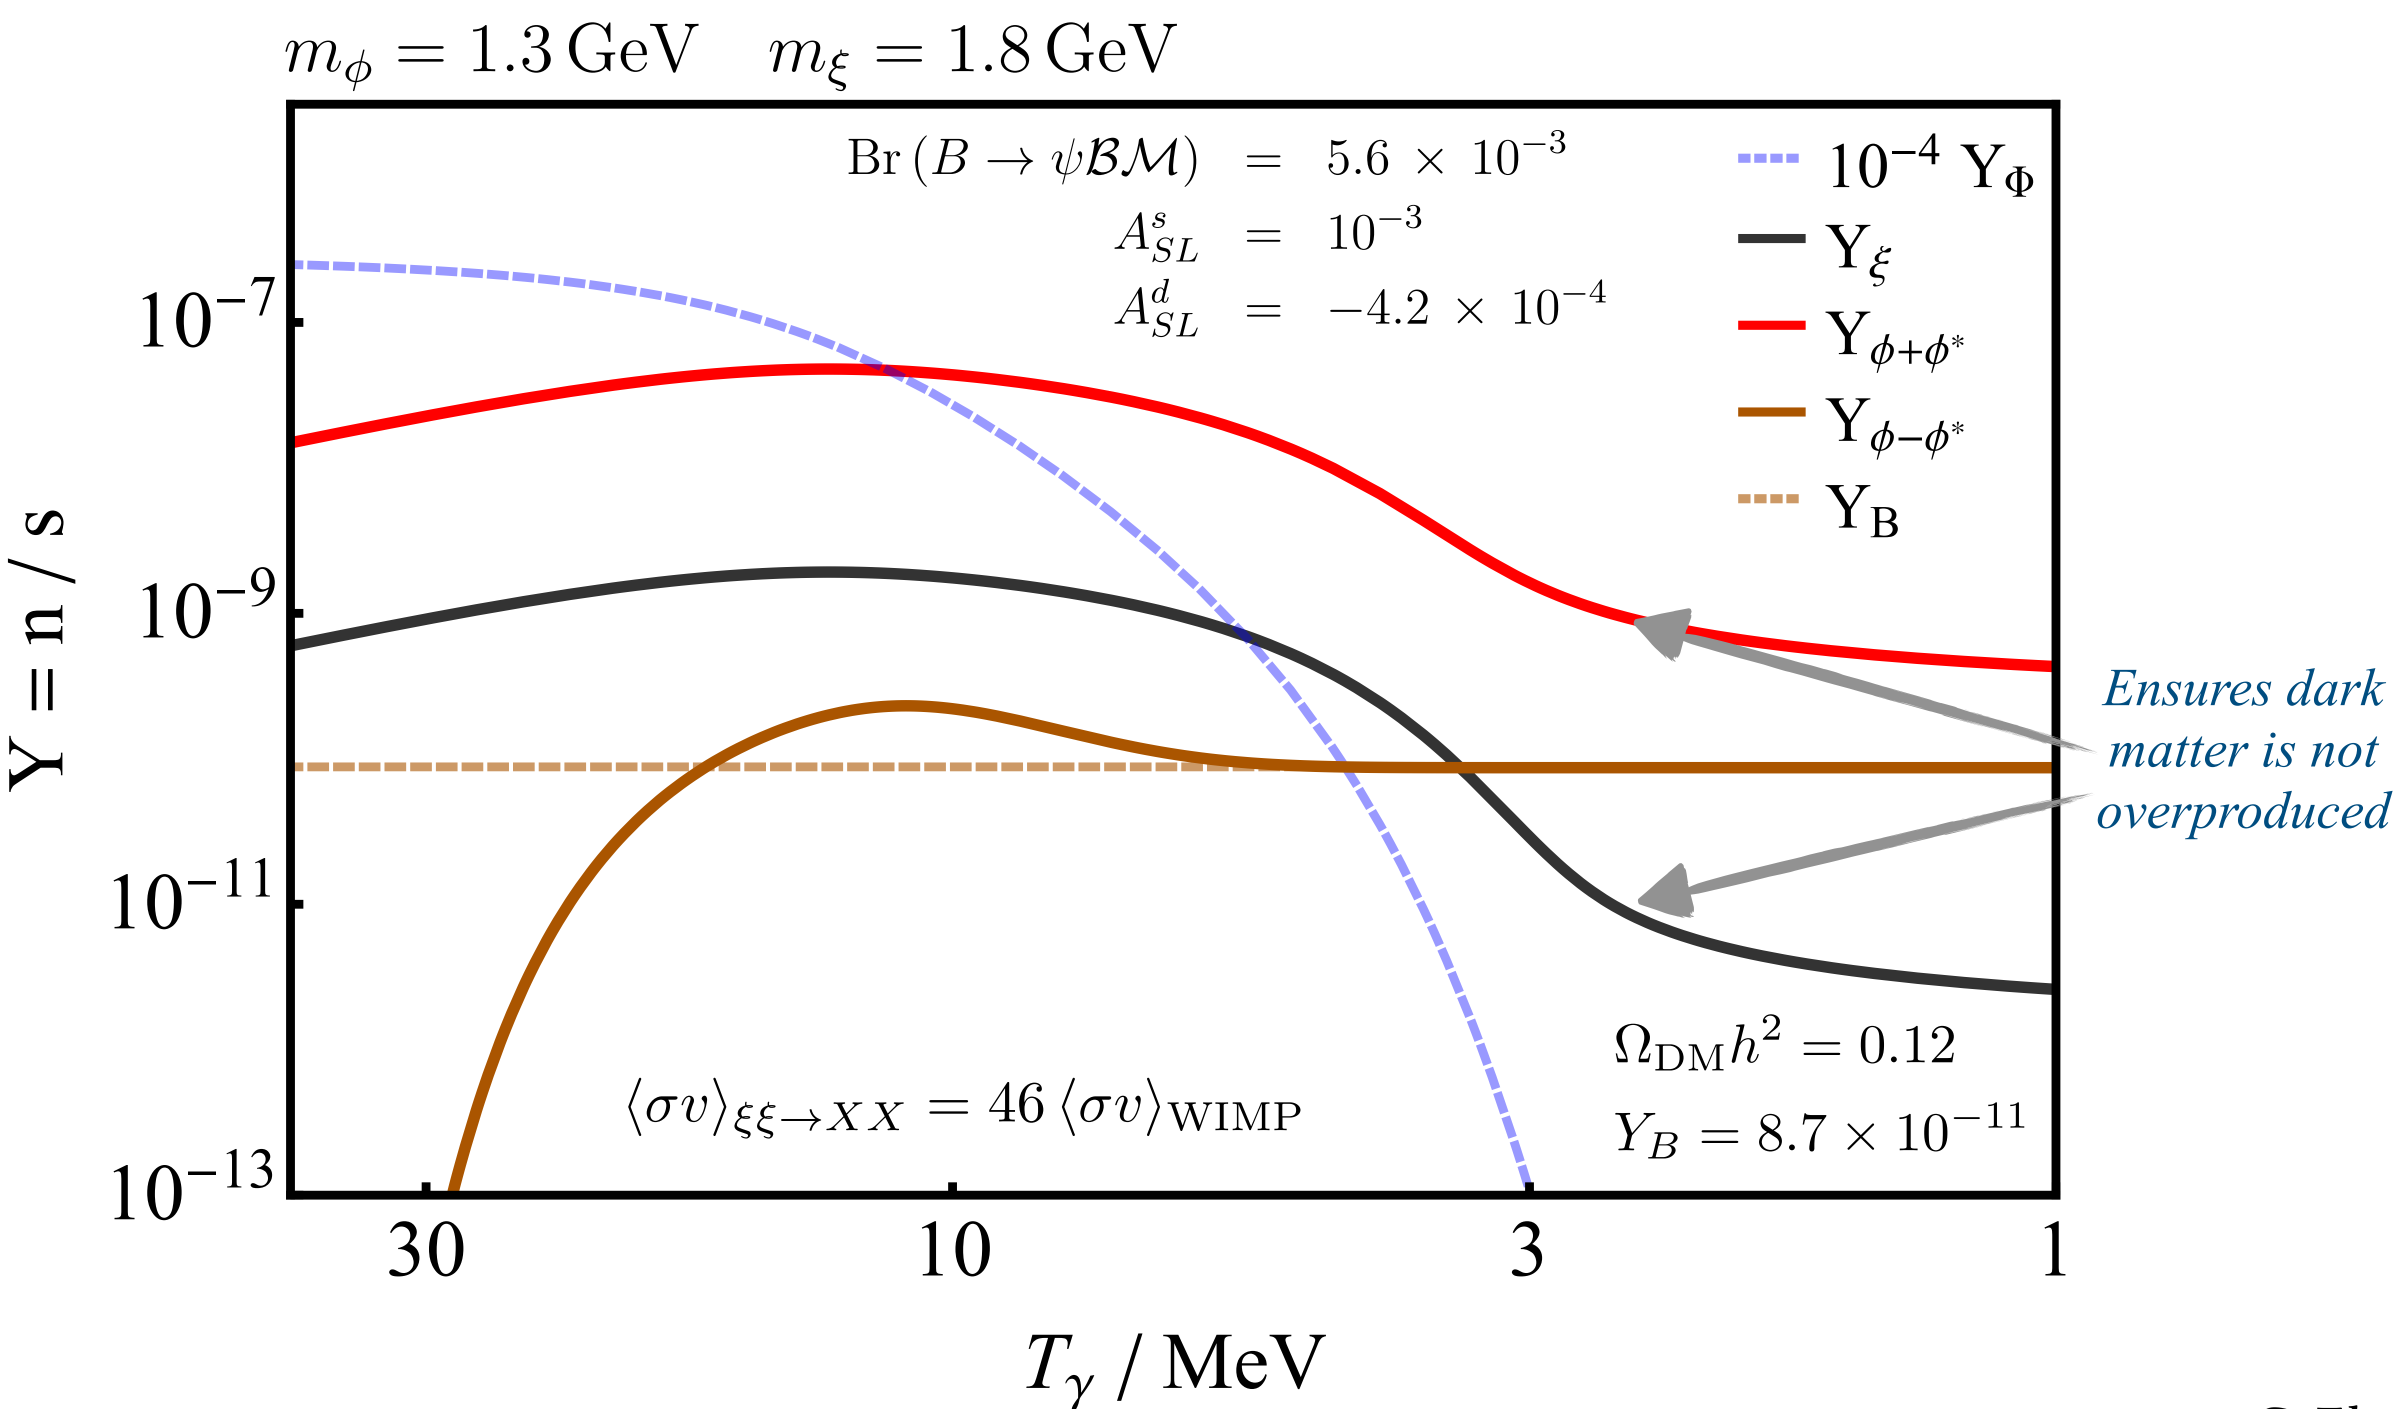
G. Elor

Example Benchmark Point



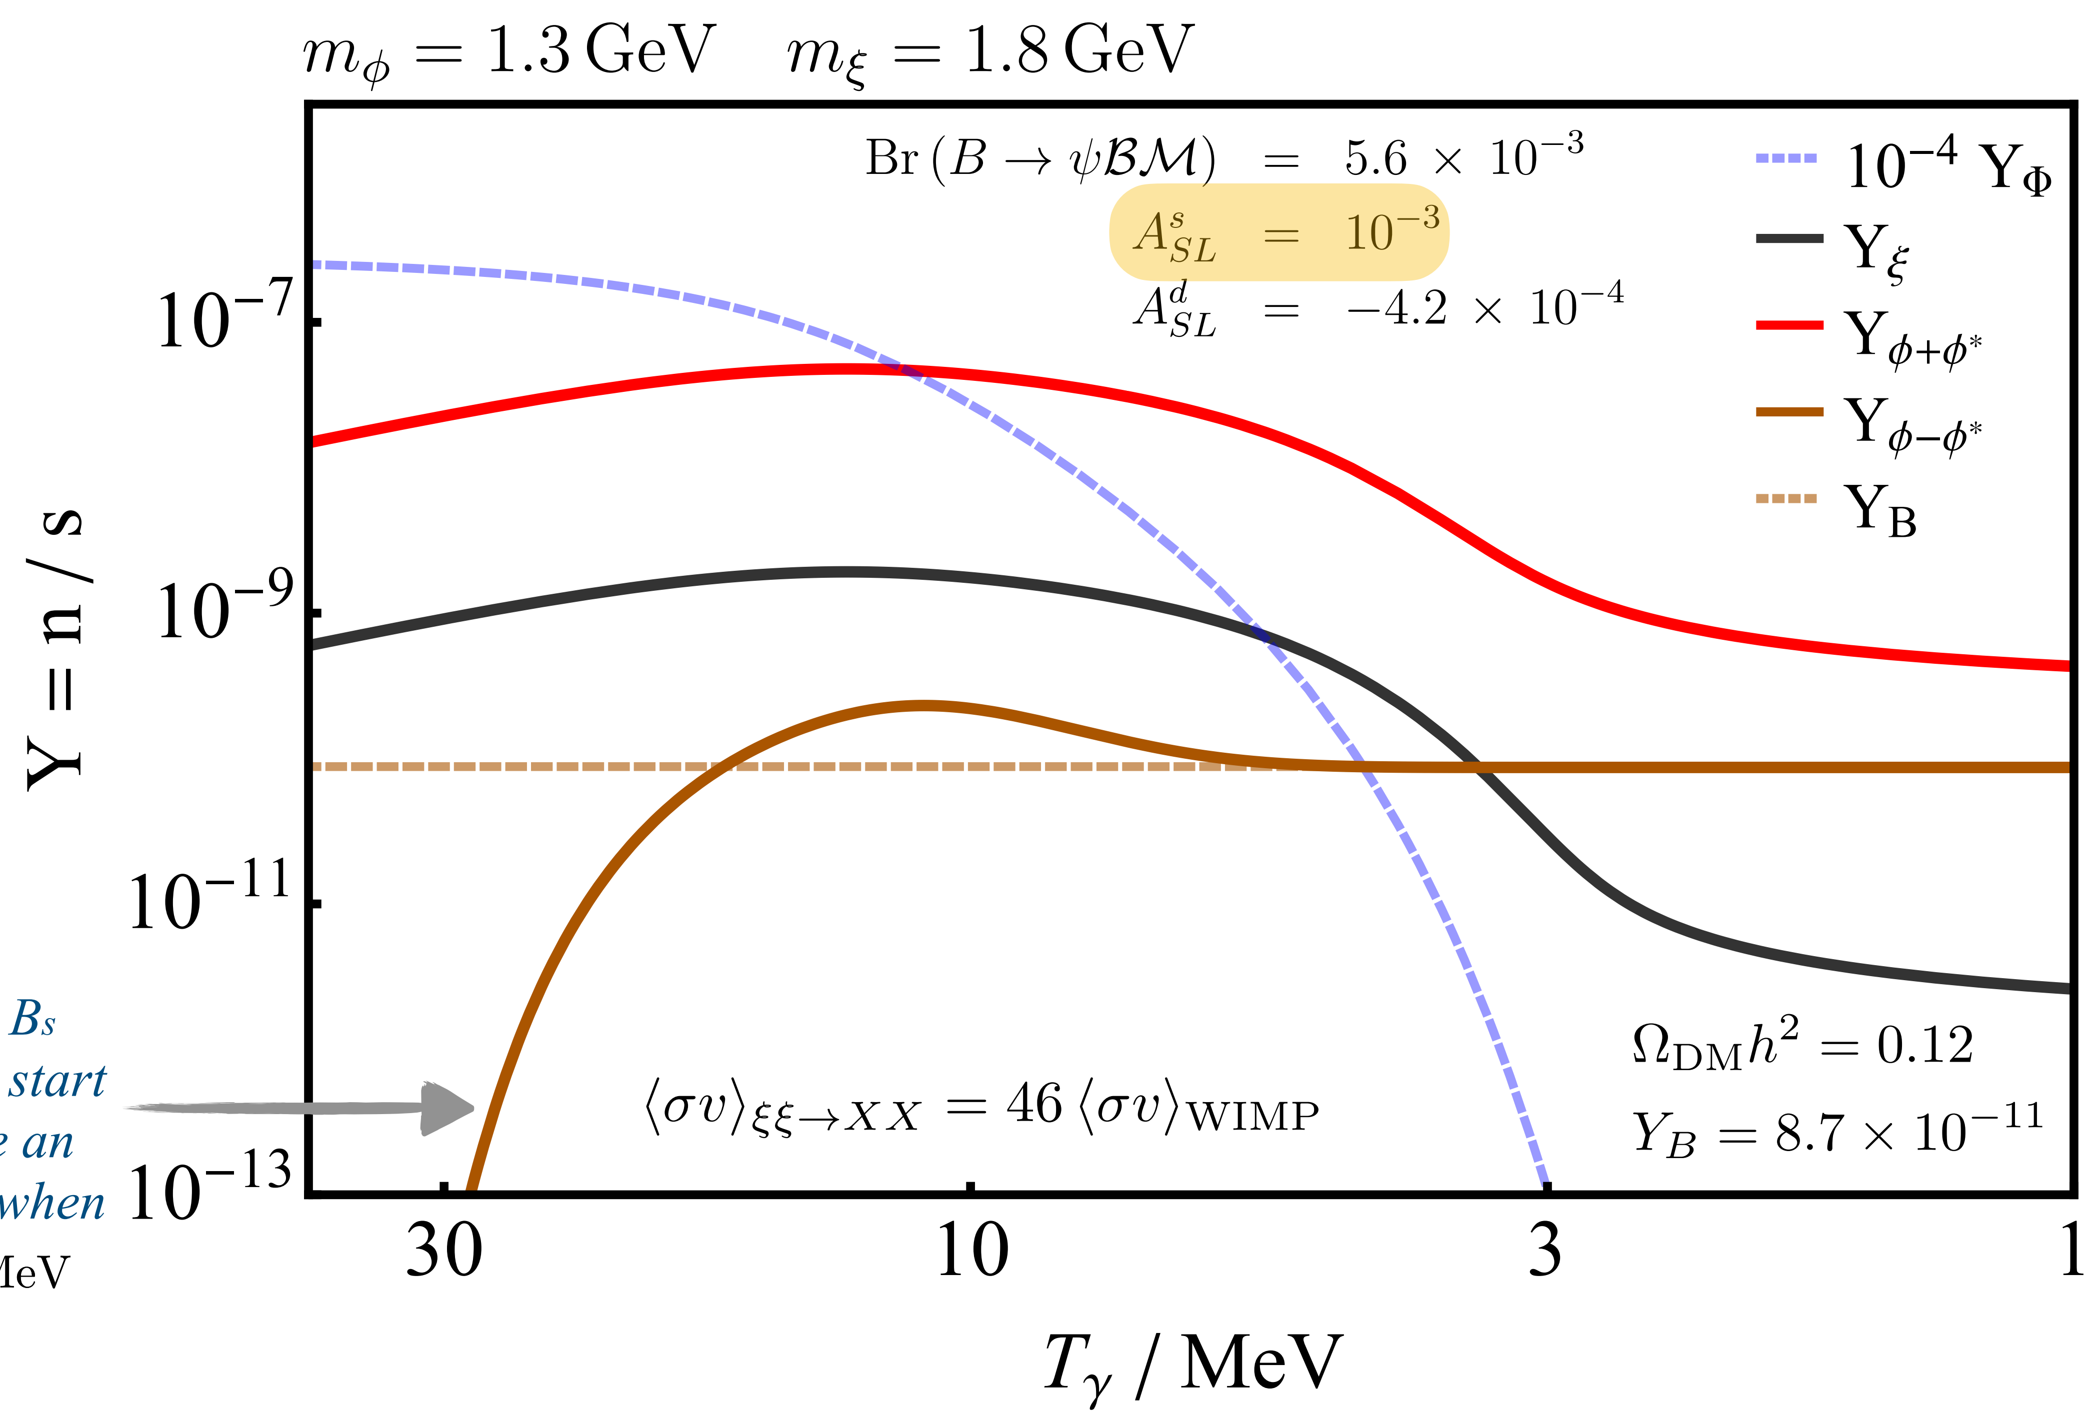
G. Elor

Example Benchmark Point



G. Elor

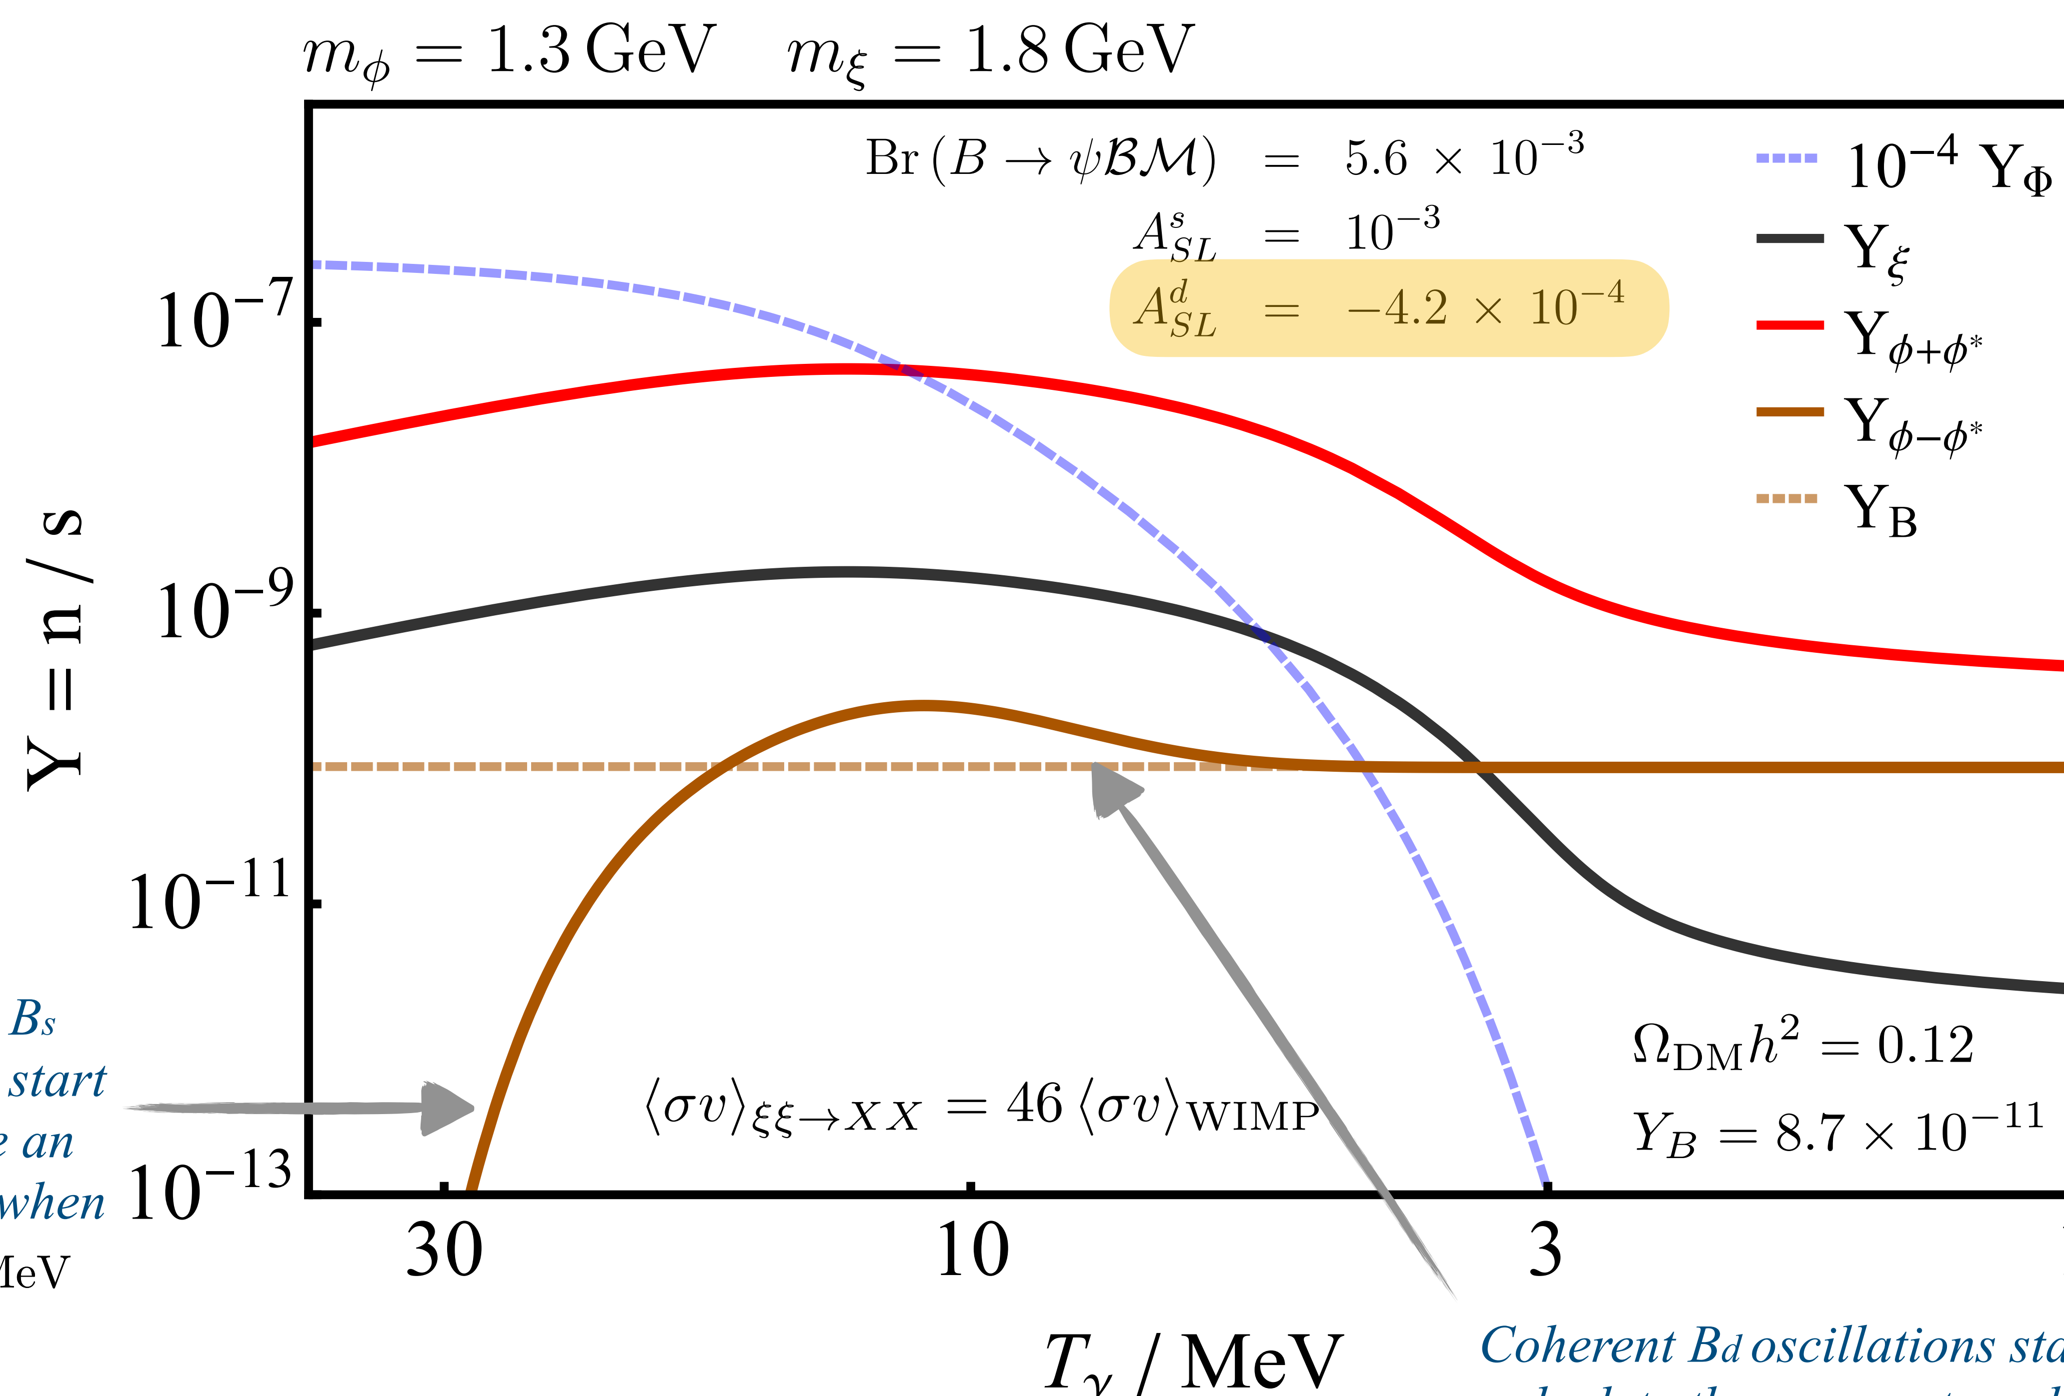
Example Benchmark Point



Coherent Bs oscillations start to produce an asymmetry when $T_{B_s} \lesssim 20\,\mathrm{MeV}$

G. Elor

Example Benchmark Point



Coherent Bs oscillations start to produce an asymmetry when $T_{B_s} \lesssim 20\,\text{MeV}$

Need a net positive asymmetry

Coherent Bd oscillations start to deplete the asymmetry when $T_{B_d} \lesssim 10\,\text{MeV}$

Numerical Result

$$\boxed{Y_{\mathcal{B}} \simeq 8.7 \times 10^{-11} \frac{\text{Br}\left(B \to \psi \mathcal{B} \mathcal{M}\right)}{10^{-2}} \sum_{q=s,d} \alpha_q \frac{A_{\text{SL}}^q}{10^{-4}}}$$

$$\Big\downarrow$$

Successful
B-Mesogenesis

$$\boxed{A_{\text{SL}}^{s,d} \times \text{Br}\left(B^0 \to \psi\, \mathcal{B}\, \mathcal{M}\right) > 10^{-6}}$$

Experimental Observables

Part II.
A Roadmap for Discovering *B*-Mesogenesis

Based on:

GE with Gonzalo Alonso-Alvarez, Miguel Escudero, [arXiv:2101.02706]

Ongoing theoretical work: GE with Gonzalo Alonso-Alvarez, Jorge Martin Camalich, Miguel Escudero, Bartosz Fornal, Benjamin Grinstein (also see white paper coming out in August)

Ongoing searches at Belle 1 and II

Possible searches at LHCb - see arXiv:2105.12668 and arXiv:2106.12870

Signals of *B*-Mesogenesis

For successful baryogenesis: $A_{\rm SL}^{s,d} \times \mathrm{Br}\left(B^0 \to \psi\, \mathcal{B}\, \mathcal{M}\right) > 10^{-6}$

Collider Signals of Baryogenesis and Dark Matter from B Mesons (*B-Mesogenesis*)

G. Elor

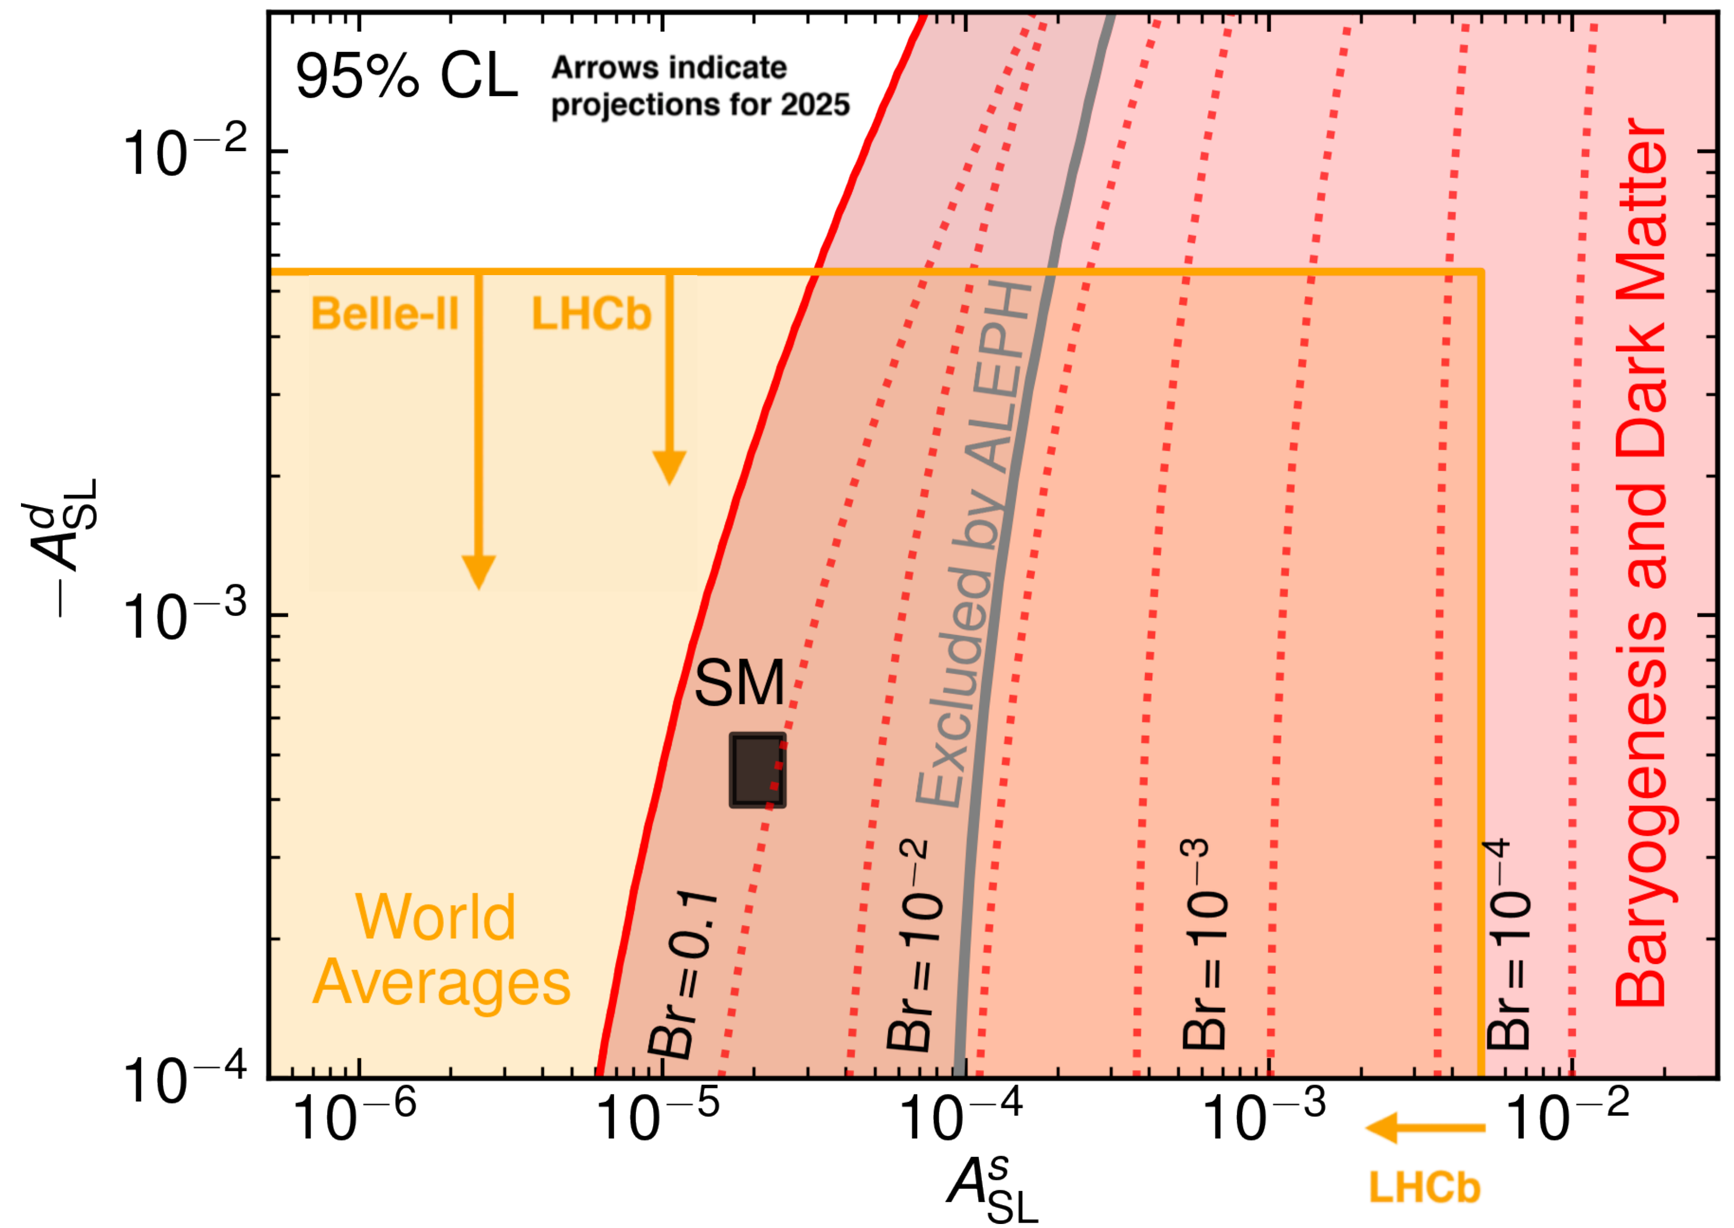
The Semi-Leptonic Asymmetry



$\lesssim 10^{-3}$

$$Y_{\mathcal{B}} \simeq 8.7 \times 10^{-11} \frac{\mathrm{Br}\left(B \to \psi \mathcal{B} \mathcal{M}\right)}{10^{-2}} \sum_{q=s,d} \alpha_q \frac{A^q_{\mathrm{SL}}}{10^{-4}}$$

for baryogenesis

$$\mathrm{Br}(B \to \psi\, \mathcal{B}\, \mathcal{M}) \gtrsim 10^{-4}$$

G. Elor

Flavorful Variations

No a priori reason to expect a particular flavor structure.

Most general interactions:

$$\boxed{\mathcal{L}_{-1/3} = -\sum_{i,j} y_{u_i d_j} Y^{\star} \bar{u}_{iR} d^c_{jR} - \sum_{k} y_{\psi d_k} Y d^c_{kR} \bar{\psi} + \text{h.c.}}$$

Possible operators:

$$\boxed{\begin{aligned} \mathcal{O}_{ud} &= \psi\, b\, u\, d \\ \mathcal{O}_{us} &= \psi\, b\, u\, s \\ \mathcal{O}_{cd} &= \psi\, b\, c\, d \\ \mathcal{O}_{cs} &= \psi\, b\, c\, s \end{aligned}}$$

B-Mesogenesis requires:

$$\boxed{\text{Br}(B \to \psi\, \mathcal{B}\, \mathcal{M}) \gtrsim 10^{-4}}$$

G. Elor

Searching for new b-Hadron Decays

Can be searched for at Belle, BaBar and LHCb

Flavorful variations:

Directly related to baryon asymmetry

Most stringent constraints actually comes from a 20 year old search at LEP

[hep-ex/0010022]

Indirectly constrains B-Mesogenesis.
Charged track is an advantage for searches

b-flavored baryon decays can yield indirect constraints.

expect: $\mathrm{Br}(\mathcal{B}_b \to \bar{\psi}\, \mathcal{M}) \;>\; 10^{-4}$

G. Elor

Searching for new b-Hadron Decays

Ongoing Belle-I and II Search

Flavorful variations:

Operator/Decay	Initial State	Final state
$\mathcal{O} = \psi\, b\, u\, d$ $\bar{b} \to \psi\, u\, d$	B_d	$\psi + n\,(udd)$
	B_s	$\psi + \Lambda\,(uds)$
	B^+	$\psi + p\,(duu)$
	Λ_b	$\bar{\psi} + \pi^0$
$\mathcal{O} = \psi\, b\, u\, s$ $\bar{b} \to \psi\, u\, s$	B_d	$\psi + \Lambda\,(usd)$
	B_s	$\psi + \Xi^0\,(uss)$
	B^+	$\psi + \Sigma^+\,(uus)$
	Λ_b	$\bar{\psi} + K^0$
$\mathcal{O} = \psi\, b\, c\, d$ $\bar{b} \to \psi\, c\, d$	B_d	$\psi + \Lambda_c + \pi^-\,(cdd)$
	B_s	$\psi + \Xi_c^0\,(cds)$
	B^+	$\psi + \Lambda_c\,(dcu)$
	Λ_b	$\bar{\psi} + \overline{D}^0$

	B^+	$\psi + \Xi_c^+\,(csu)$
	Λ_b	$\bar{\psi} + D^- + K^+$

Results to be made public at the next collaboration meeting. They plan to look for other decay modes as well

G. Elor

Searching for new *b*-Hadron Decays

Possibilities at LHCb

[See our white paper on "Stealth Physics at LHCb" 2105.12668]

- No handle on initial energy of decaying *B* meson so measuring missing energy is non-trivial.
- But, LHCb has advantages: larger number of *B* mesons produced than at Belle, excellent vertex resolution, and good particle reconstruction efficiencies.
- Some possibilities for searches do exist. e.g. new paper just last week!

Prospects on searches for baryonic Dark Matter produced in *b*-hadron decays at LHCb

[2106.12870]

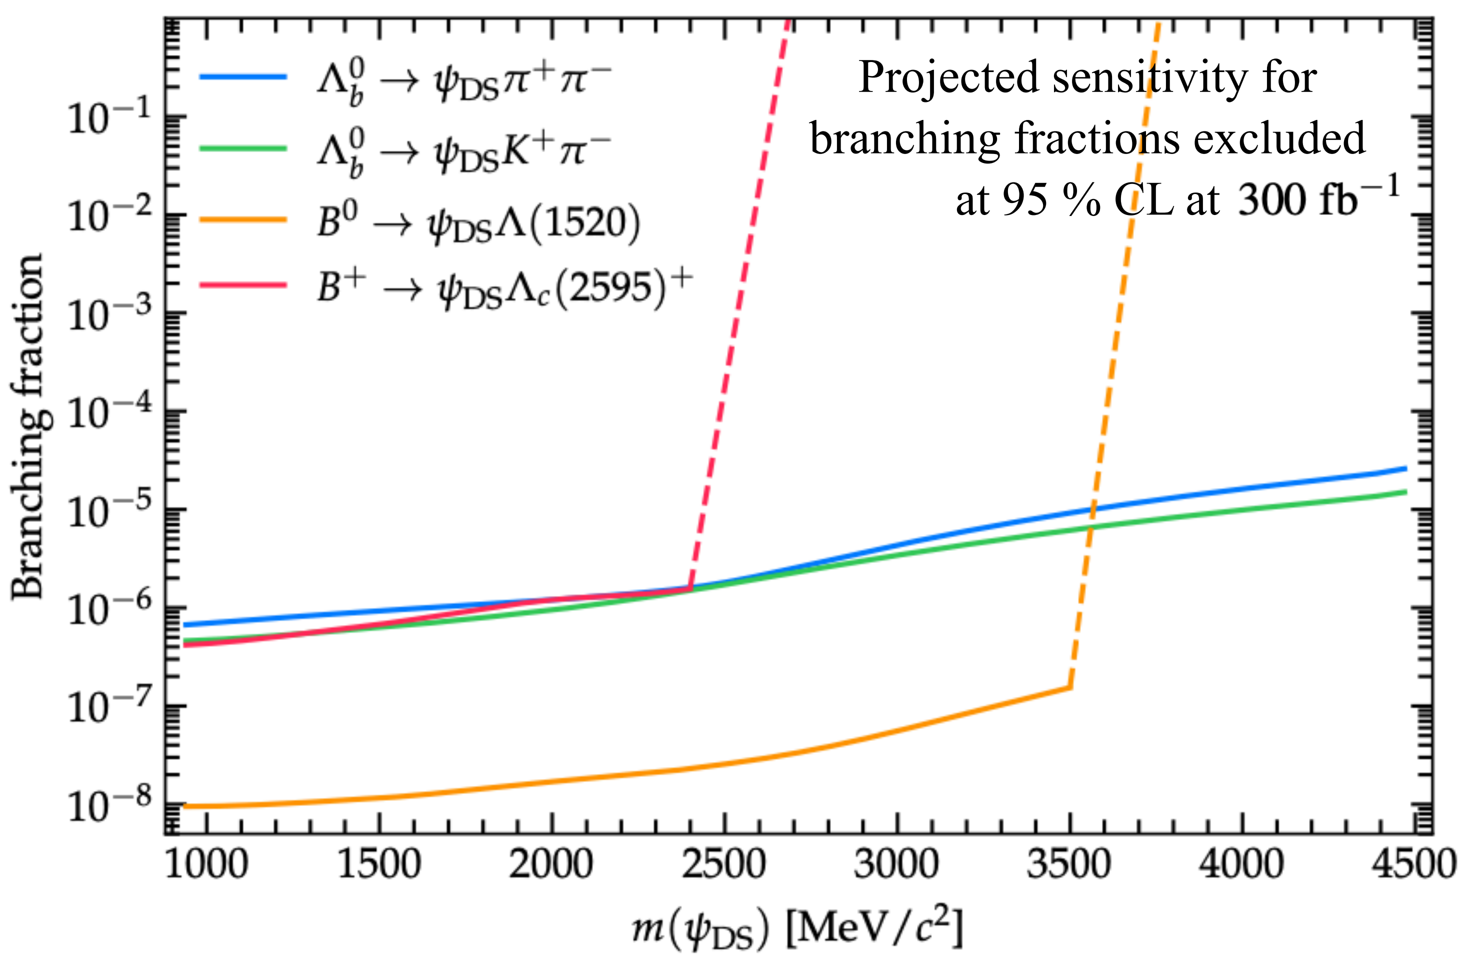
Searching for new b-Hadron Decays

Proposed Search at LHCb [2106.12870]

- Search for decays of B mesons and b-Flavored baryons into an excited baryon in the final state $B \to \psi \mathcal{B}^\star$
- The excited baryon promptly decay at the same decay point as original decay, allowing one to trigger on this decay.



Searching for new b-Hadron Decays

Caution: Inclusive vs. Exclusive Rates

- All decays (and their searches) discussed thus far have been *exclusive*. But, the observable controlling the baryon asymmetry is an *inclusive* rate.

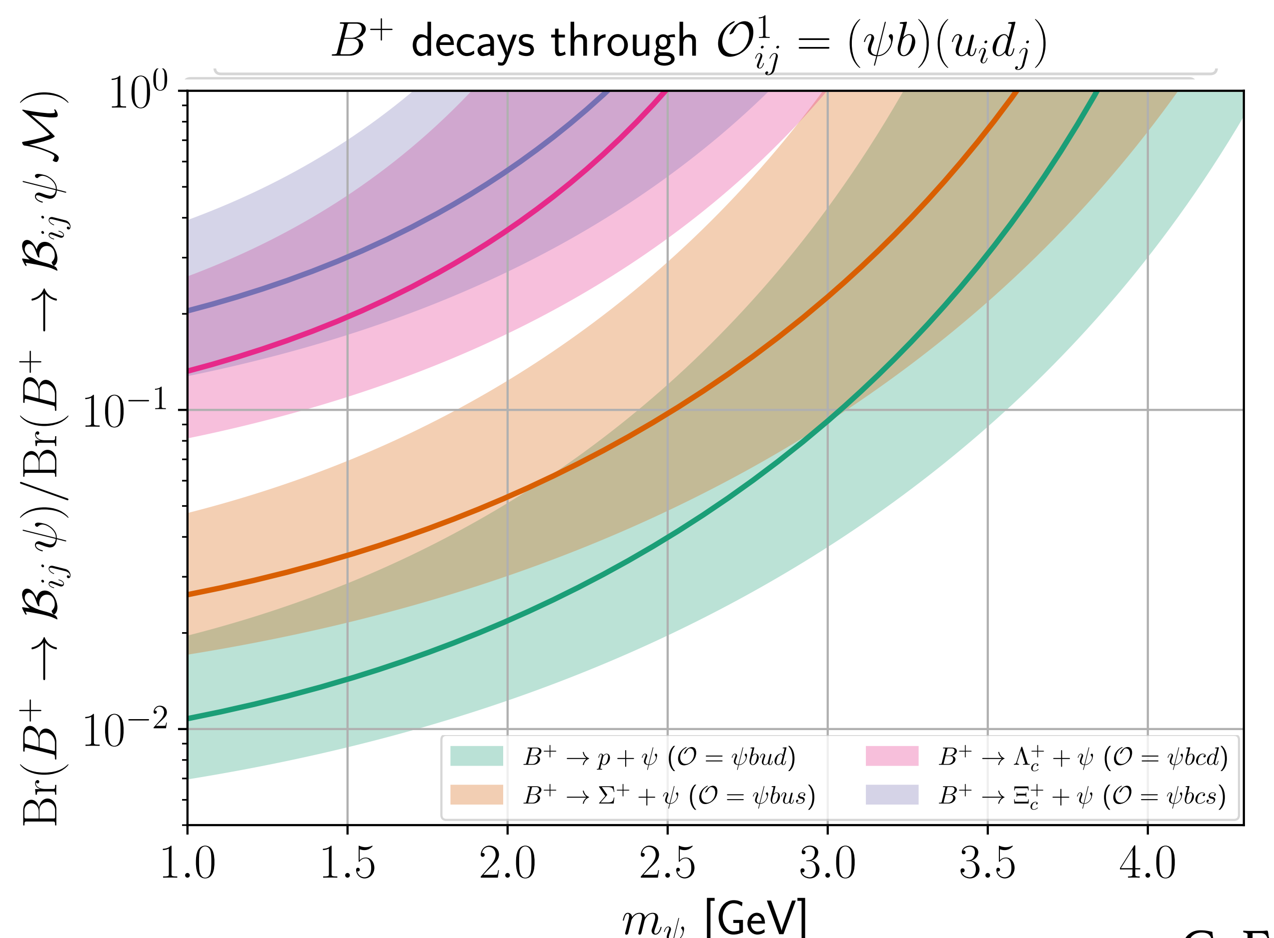
$$\boxed{\mathrm{Br}(B \to \psi\, \mathcal{B}\, \mathcal{M}) \gtrsim 10^{-4}}$$

- Need a dedicated calculation using QCD sum rules or lattice techniques etc. to calculate form factors. Beyond my current expertise….

- Phase space method

  [Bigi, Phys.Lett.B 106, 510 (1981)]

$$\boxed{\frac{\mathrm{Br}\,(B \to \psi\, \mathcal{B})}{\mathrm{Br}(B \to \psi\, \mathcal{B}\, \mathcal{M})} \gtrsim (1-10)\,\%\,.}$$



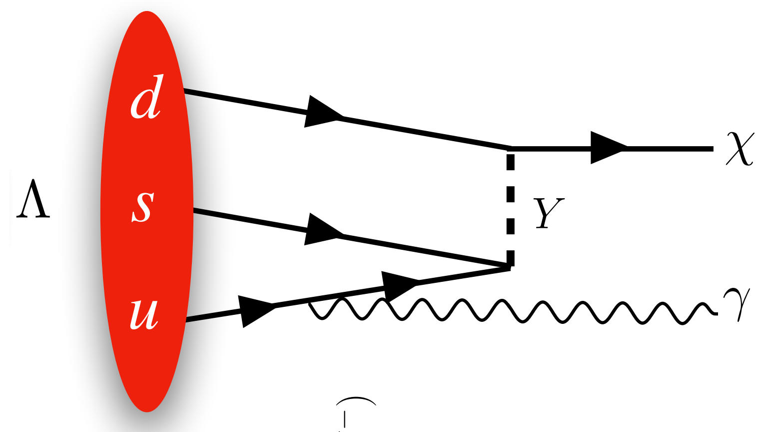
G. Elor

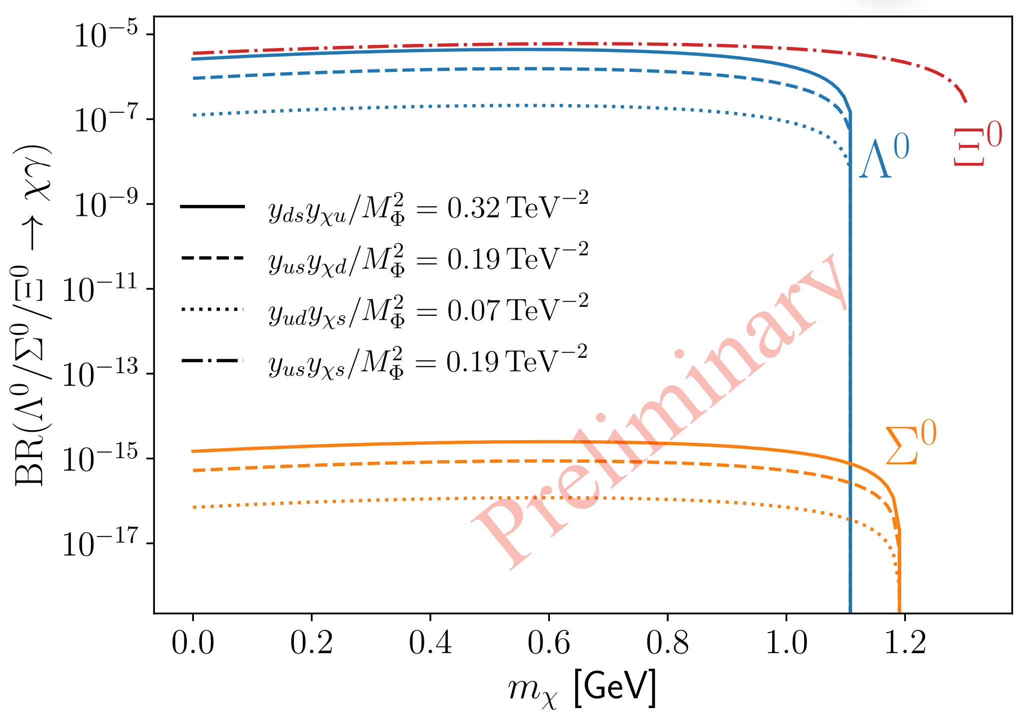
New Hyperon Decays

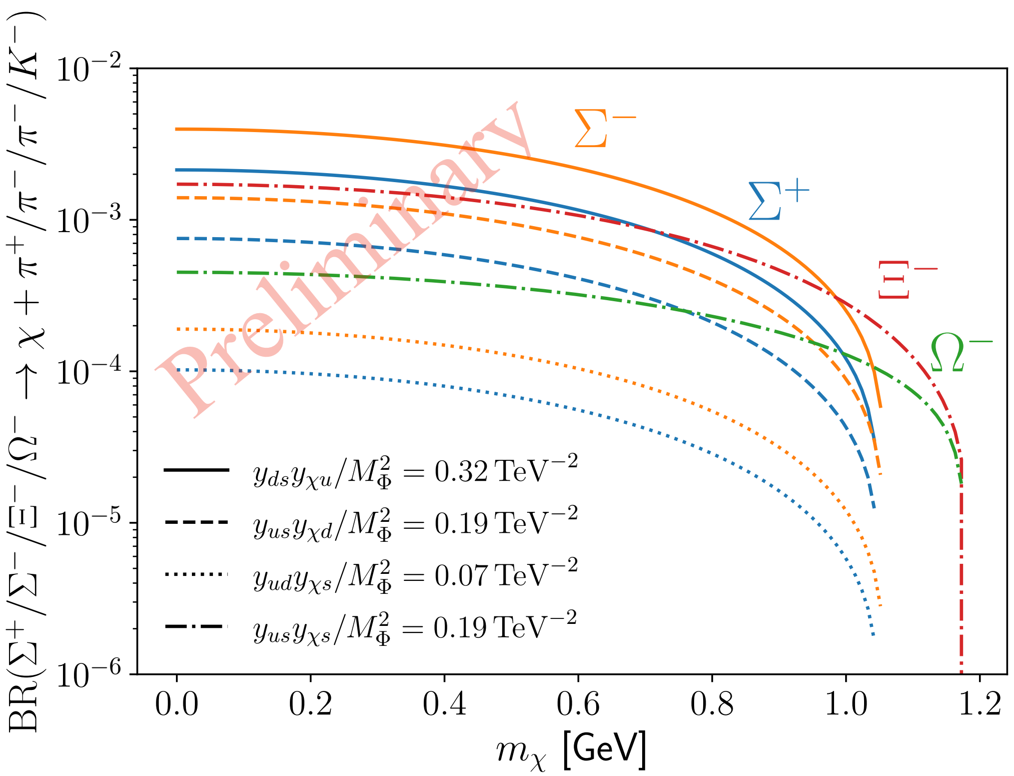
Light hadrons: we can compute form factors by matching onto chiral EFT.

Hyperon decays are another indirect probe of B-Mesogenesis and are of interest at BESIII, Belle-II, and LHCb

e.g.





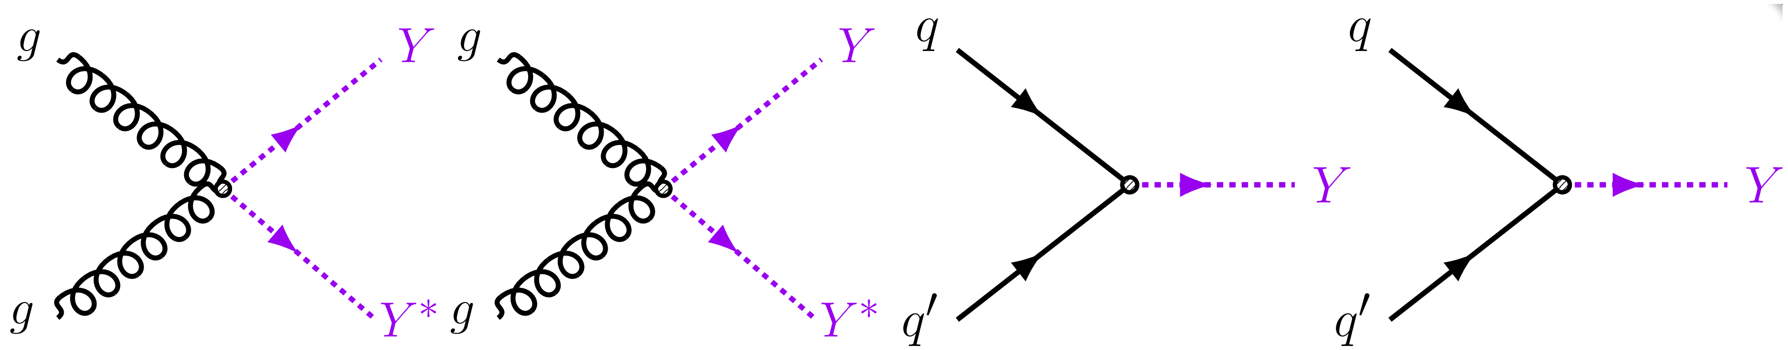


[GE with Gonzalo Alonso-Alvarez, Jorge Martin Camalich, Miguel Escudero, Bartosz Fornal, Benjamin Grinstein]

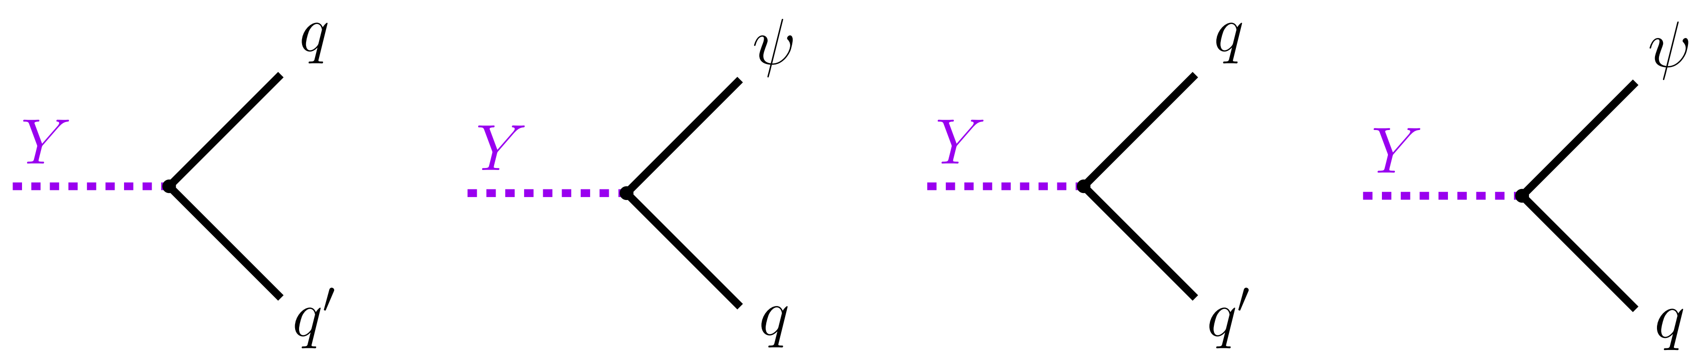
Colored Triplet Scalar

Constraints from LHC squark searches

Production:



Decay:



Signature:	4 jets	2 jets + MET	dijet	jet + MET
Search:	ATLAS [1710.07171]	ATLAS [2010.14293] CMS [1908.04293]	CMS [1806.00843]	ATLAS [1711.03301]
Constraint:	$M_Y > 0.5\,\text{TeV}$	$M_Y > 1.2\,\text{TeV}$	$M_Y > 1 - 7\,\text{TeV}$	$M_Y > 1 - 7\,\text{TeV}$

G. Elor

Colored Triplet Scalar

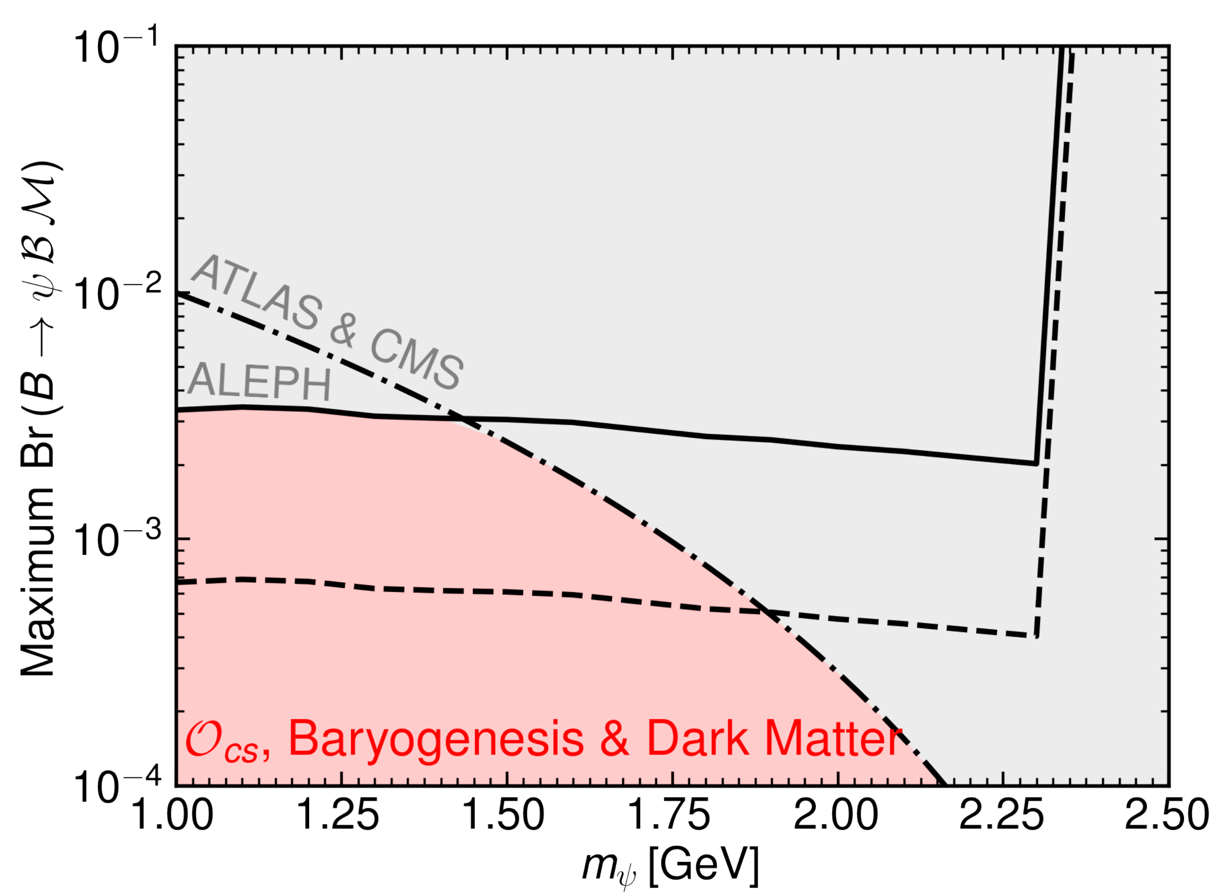
Constraints from LHC squark searches

B-Mesogenesis requires: $\boxed{\mathrm{Br}(B \to \psi\, \mathcal{B}\, \mathcal{M}) \simeq 10^{-3} \left(\frac{\Delta m}{3 \text{ GeV}}\right)^4 \left(\frac{1.5 \text{ TeV}}{M_Y} \frac{\sqrt{y_{ub} y_{\psi d}}}{0.53}\right)^4 \gtrsim 10^{-4}}$

$$\Delta m = m_B - m_\psi - m_{\mathcal{B}} - m_{\mathcal{M}}$$

Since collider bounds depend on the ratio $\frac{\sqrt{y_{u_i d_j} y_{\psi d_k}}}{M_Y}$ they will in turn constrain the branching fraction.

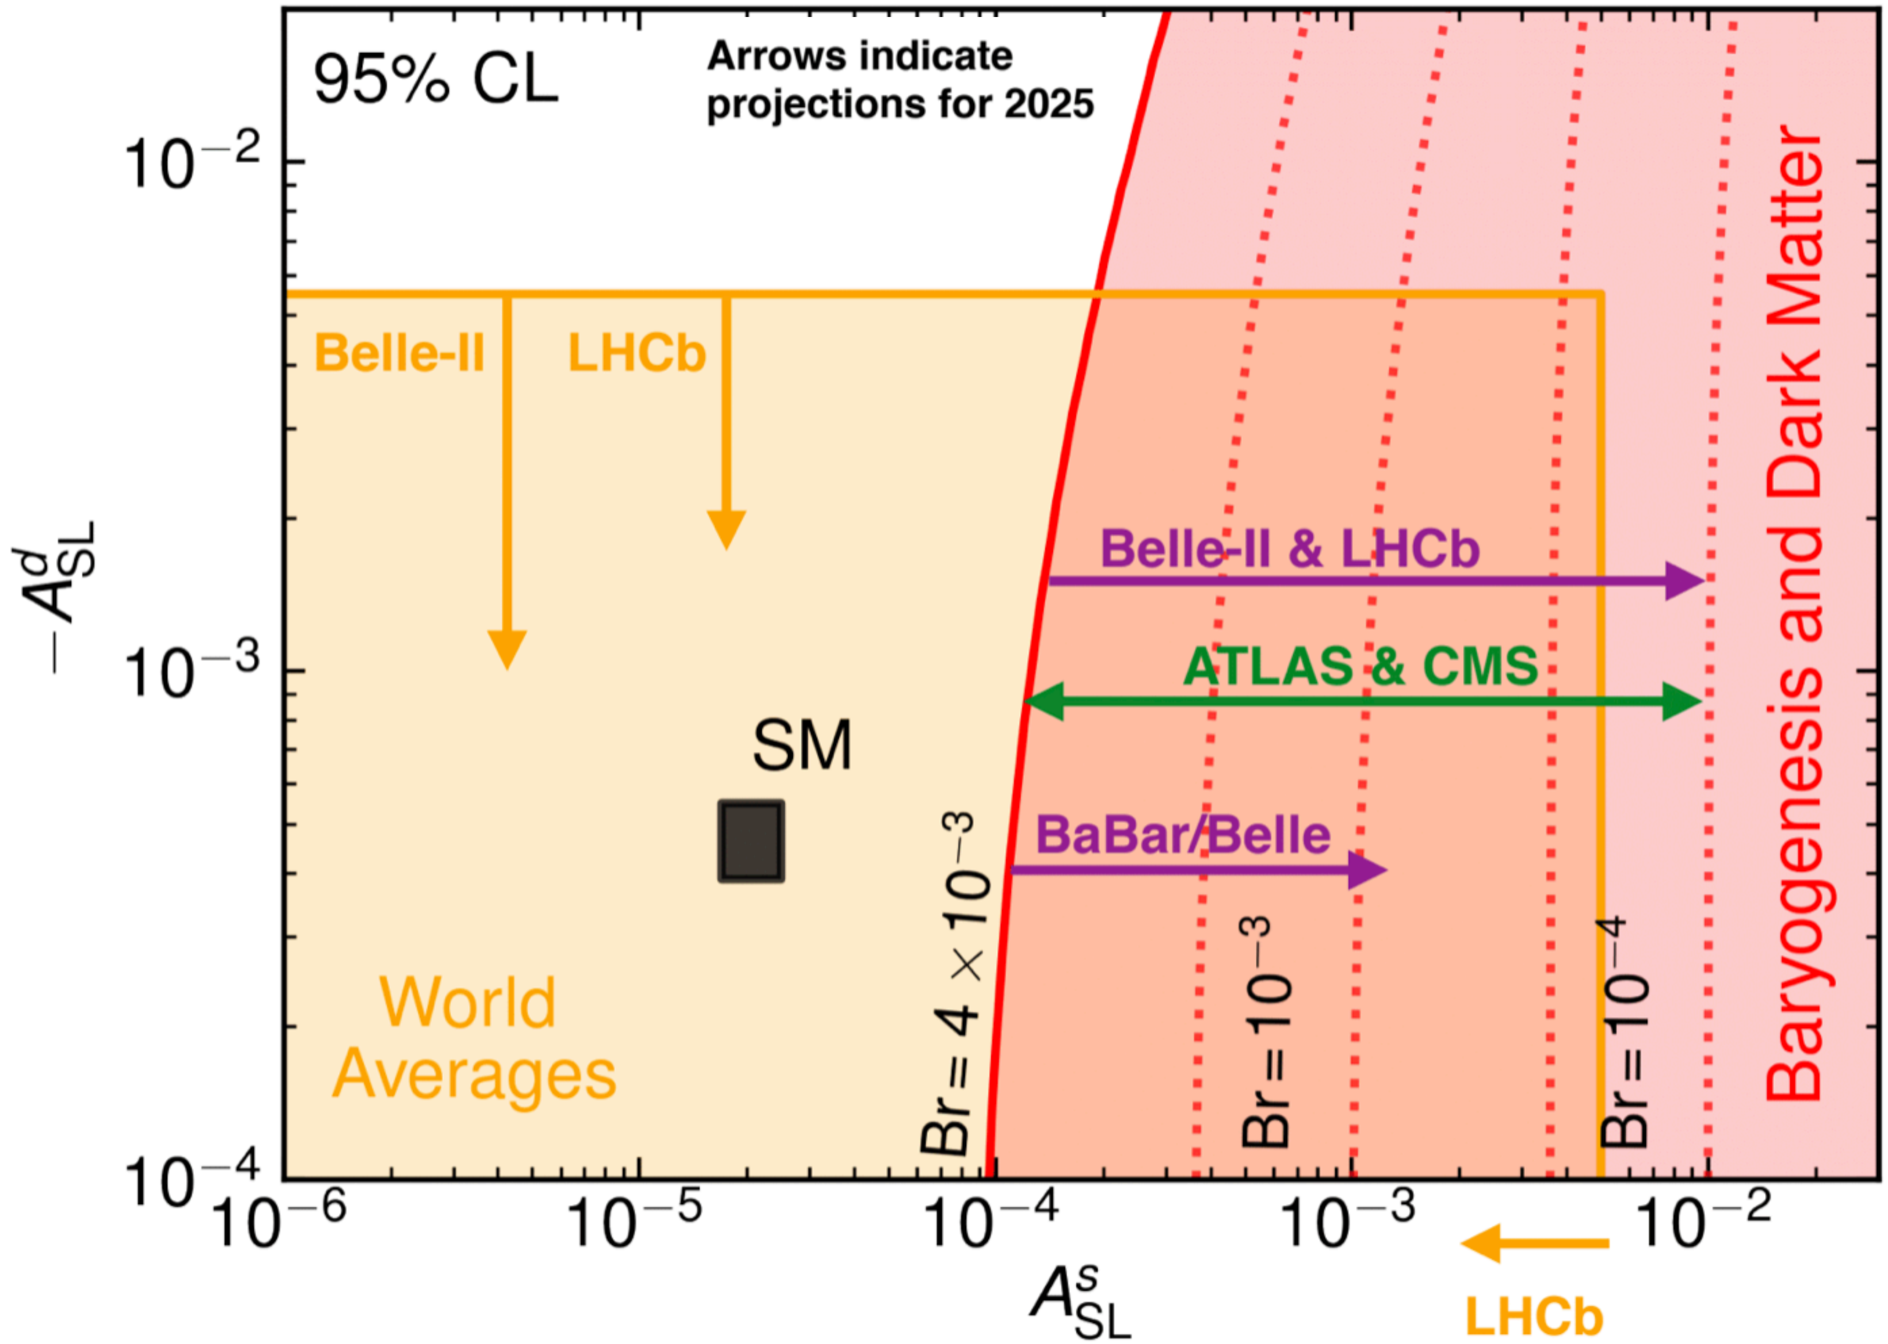
e.g.



G. Elor

Discovering *B*-Mesogenesis Outlook

Could be fully tested in but a few years.

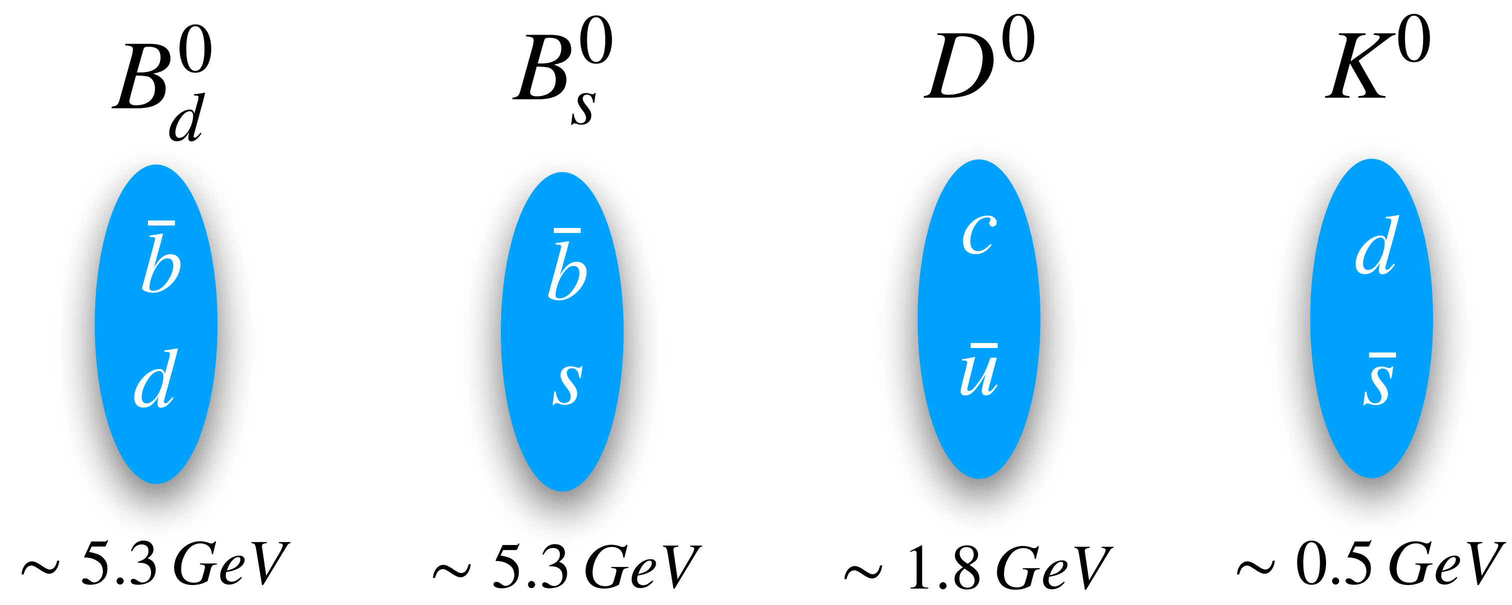


Discovering *B*-Mesogenesis Outlook

Predictions and Signals of *B*-Mesogenesis

- New *B* meson decay modes with $\boxed{\mathrm{Br}(B \to \psi\, \mathcal{B}\, \mathcal{M}) \gtrsim 10^{-4}}$
- Positive semileptonic asymmetry $\boxed{A^q_{\mathrm{SL}} > 10^{-4}}$
- The existence TeV scale colored triplet scalar
- Implications for flavor structure.
- Many more signals possible given a UV model see e.g. [1907.10612]

Why B Mesons?



- Kinematics: Dark baryons must be GeV scale. Only B mesons are heavy enough to decay into GeV scale. Charge dark particle under lepton number instead, then it can be light.

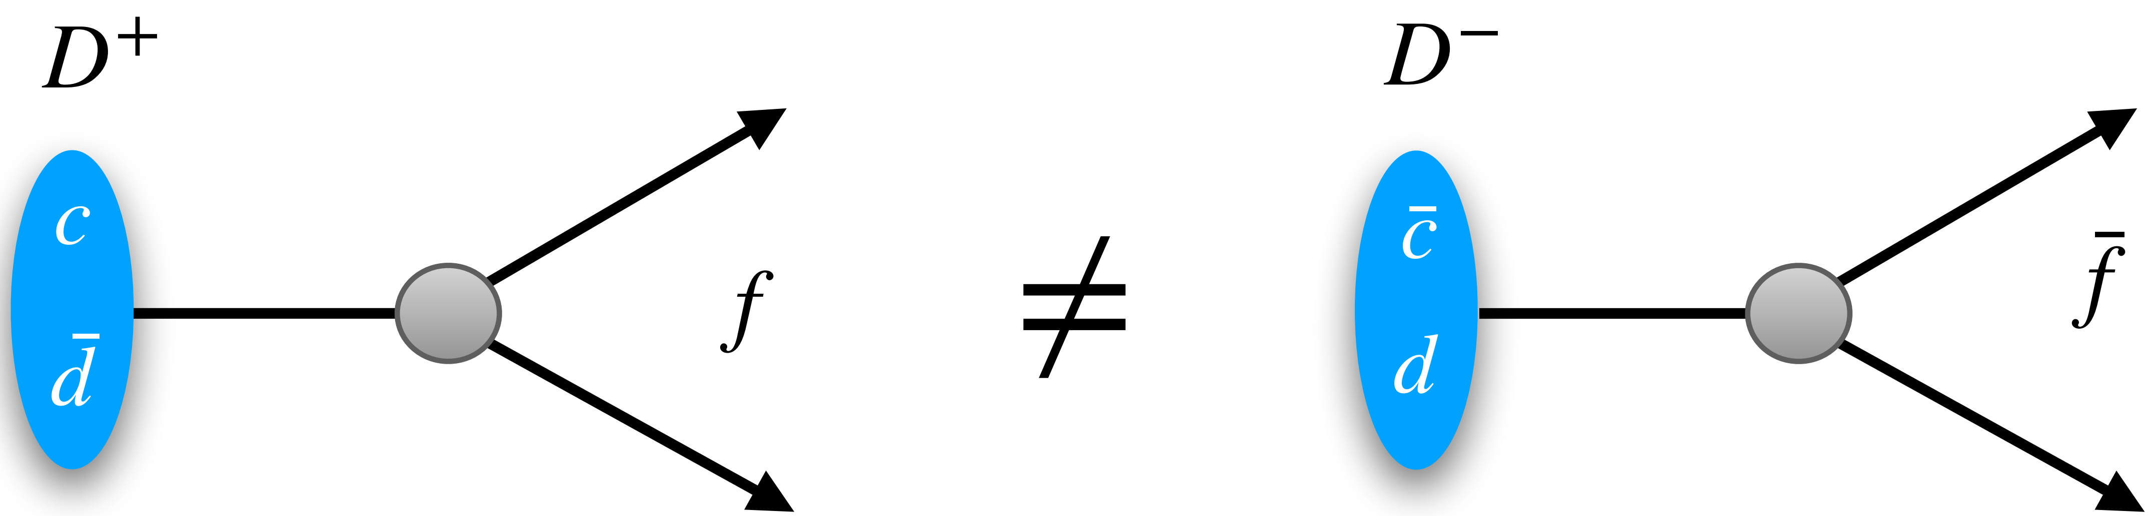
- Neutral D Mesons don't have a lot of CP violation in their oscillations, but charged D Mesons have a lot of CP violation in their decays.

Part III.
D-Mesogenesis

Based on:

GE with Robert McGehee, Phys. Rev. D [arXiv:2011.06115]

CPV in Charged D Decays



Observable: $$A_{CP}^f = \frac{\Gamma(D^+ \to f) - \Gamma(D^- \to \bar{f})}{\Gamma(D^+ \to f) + \Gamma(D^- \to \bar{f})}$$

G. Elor

CPV in Charged D Decays

Example: Standard Model decays to an odd number of charged pions

D^+ decay mode	$A^f_{CP}/10^{-2}$	D^+ decay mode	$A^f_{CP}/10^{-2}$
$K^0_S\pi^+$	-0.41 ± 0.09	$\pi^+\eta$	1.0 ± 1.5
$K^-\pi^+\pi^+$	-0.18 ± 0.16	$\pi^+\eta'(958)$	-0.6 ± 0.7
$K^-\pi^+\pi^+\pi^0$	$-0.3 \pm 0.6 \pm 0.4$	$K^+K^-\pi^+$	0.37 ± 0.29
$K^0_S\pi^+\pi^0$	$-0.1 \pm 0.7 \pm 0.2$	$\phi\pi^+$	0.01 ± 0.09
$K^0_S\pi^+\pi^+\pi^-$	$0.0 \pm 1.2 \pm 0.3$	$a_0(1450)^0\pi^+$	$-19 \pm 12^{+8}_{-11}$
$\pi^+\pi^0$	2.4 ± 1.2	$\phi(1680)\pi^+$	$-9 \pm 22 \pm 14$
$\pi^+\eta$	1.0 ± 1.5	$\pi^+\pi^+\pi^-$	-1.7 ± 4.2

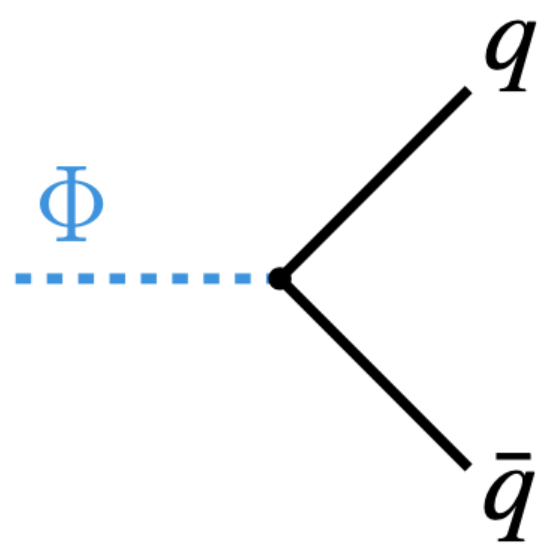
Not a small number if we want to explain $Y_B^{\rm obs} = (8.718 \pm 0.004) \times 10^{-11}$

G. Elor

Sakharov I. Out of Equilibrium

Late decay of an "inflaton-like" field

Decays at: $\Gamma_\Phi = 4H\,(T_R)$ to quarks $m_\Phi \in [5\,\mathrm{GeV}\,,\ 100\,\mathrm{GeV}]$



$$\boxed{3.5\,\mathrm{MeV} \lesssim T_\mathrm{R} \lesssim 20\,\mathrm{MeV}}$$

Before BBN

After QCD phase transition

Decays at: $\boxed{3.5\,\mathrm{MeV} \lesssim T_\mathrm{R} \lesssim 20\,\mathrm{MeV}}$

Asymmetry in charged pions

Before BBN

D mesons decay rather than scatter

G. Elor

Sakharov III. *B* Violation?

Need a way to change baryon number

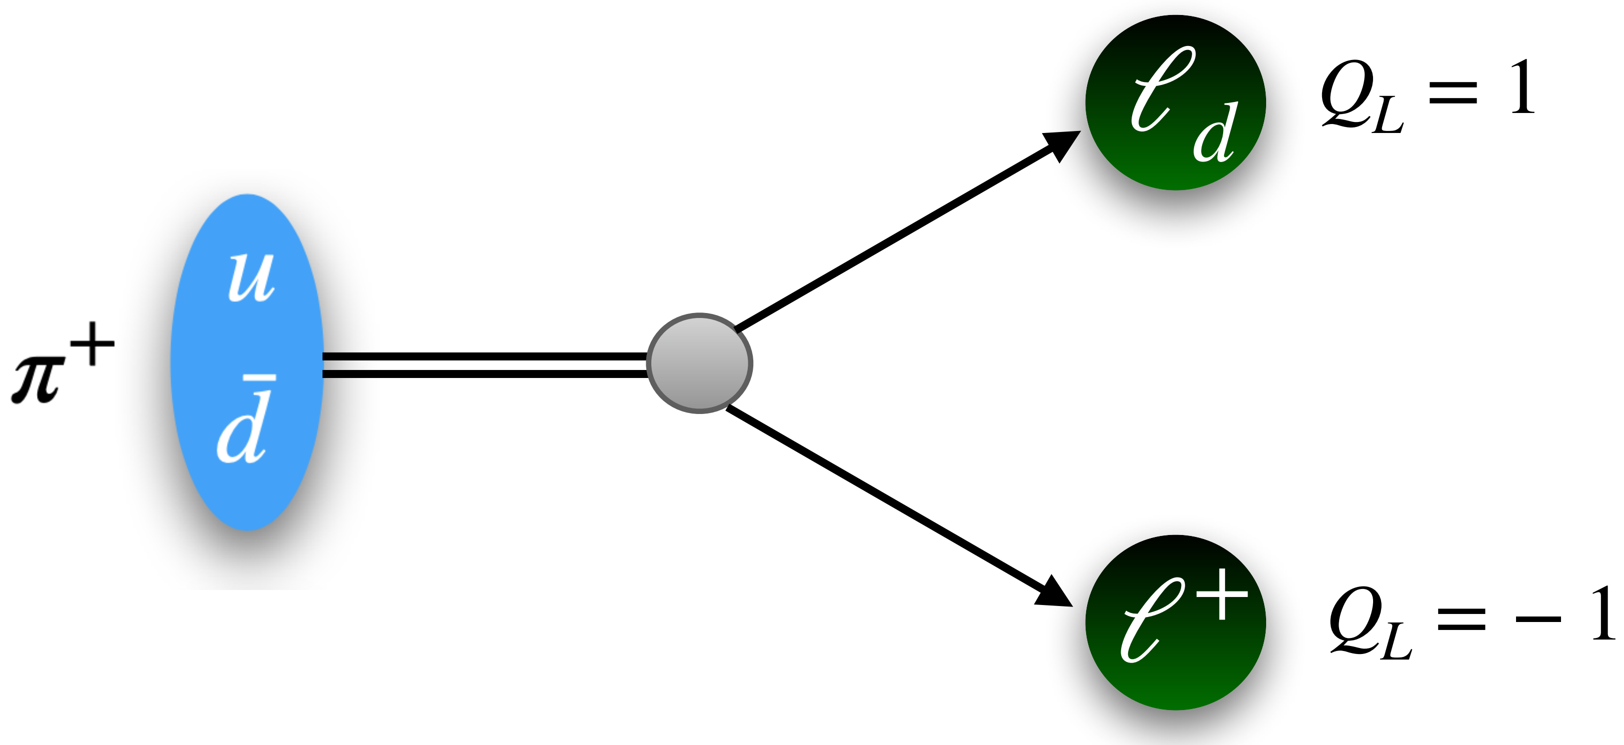
Hide baryon *and lepton* number in a dark sector without violating either.

First generate a *lepton asymmetry*

Dark Sector Lepton

Portal Operator: $$\boxed{\mathcal{O} = \frac{1}{\Lambda^2}\left[\bar{d}\Gamma^\mu u\right]\left[\bar{\ell}_d\Gamma_\mu \ell\right] + \text{h.c.}}$$

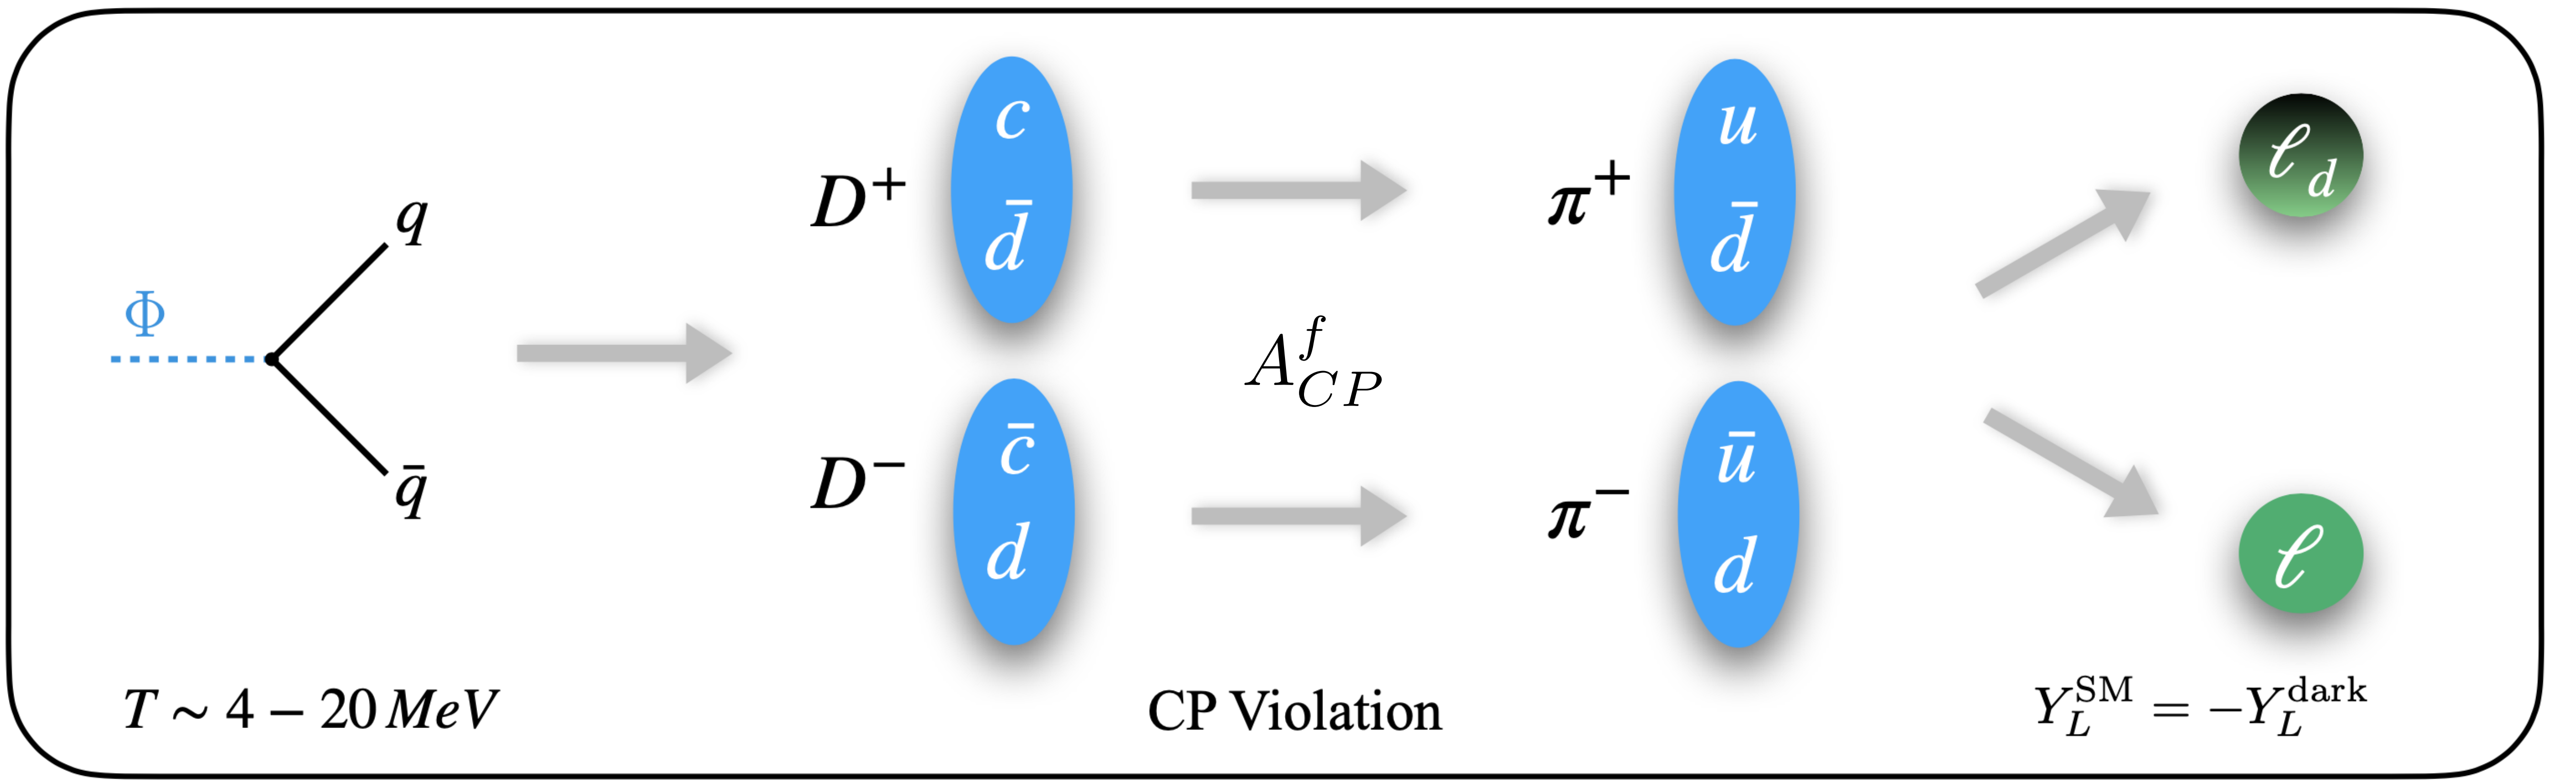
Pion Decays: $\pi^+ \to \ell_d + \ell^+ \,, \quad m_{\ell_d} < m_{\pi^+} - m_\ell$ Can be light



G. Elor

Generating a Lepton Asymmetry

Equal and opposite dark/visible sector lepton asymmetry



$$Y_L^{\rm dark} \equiv \left(\frac{n_{\ell_d} - n_{\bar{\ell}_d}}{s}\right) \propto \; {\rm Br}\left(\pi^+ \to \ell_d + \ell^+\right) \sum_f A^f_{\rm CP} \times {\rm Br}\left(D^+ \to f\right)$$

G. Elor

Generating a Baryon Asymmetry

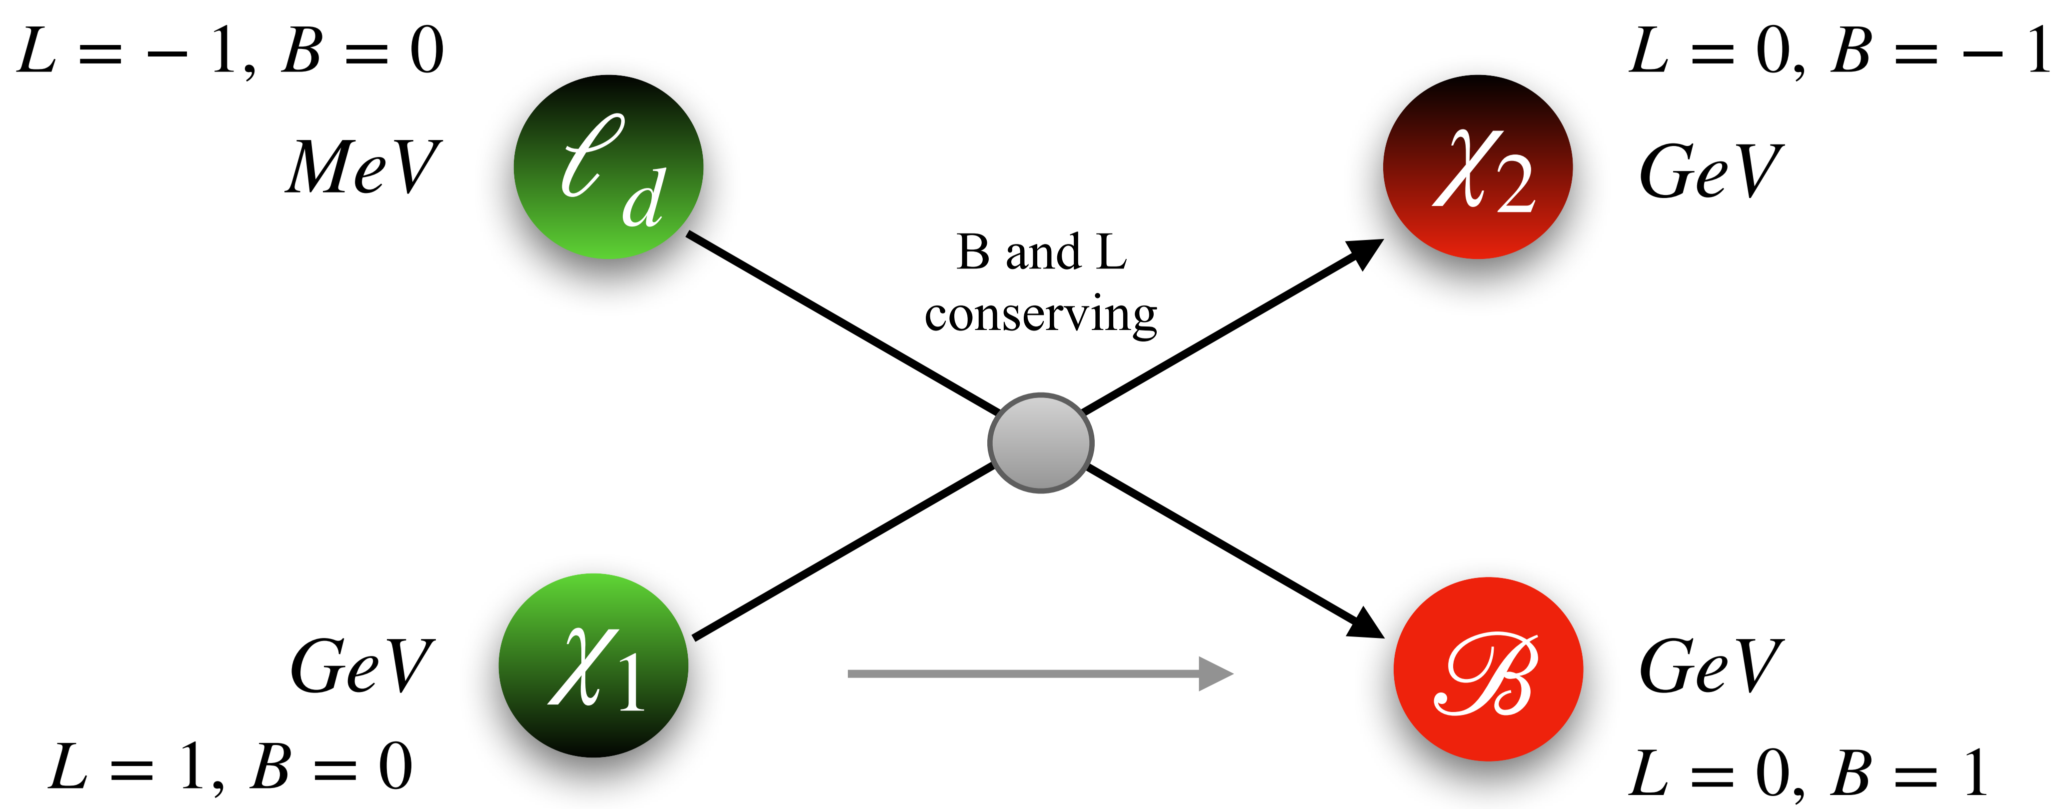
When you make the Universe at 20 MeV, you (of course) can not use Electroweak Sphalerons to transfer a lepton into a baryon asymmetry.

You also don't need them…

Freezing-In the Baryon Asymmerty

Scattering off dark sector states charged under SM L and/or B

$$\bar{\ell}_d + \chi_1 \to \chi_2 + \mathcal{B}$$



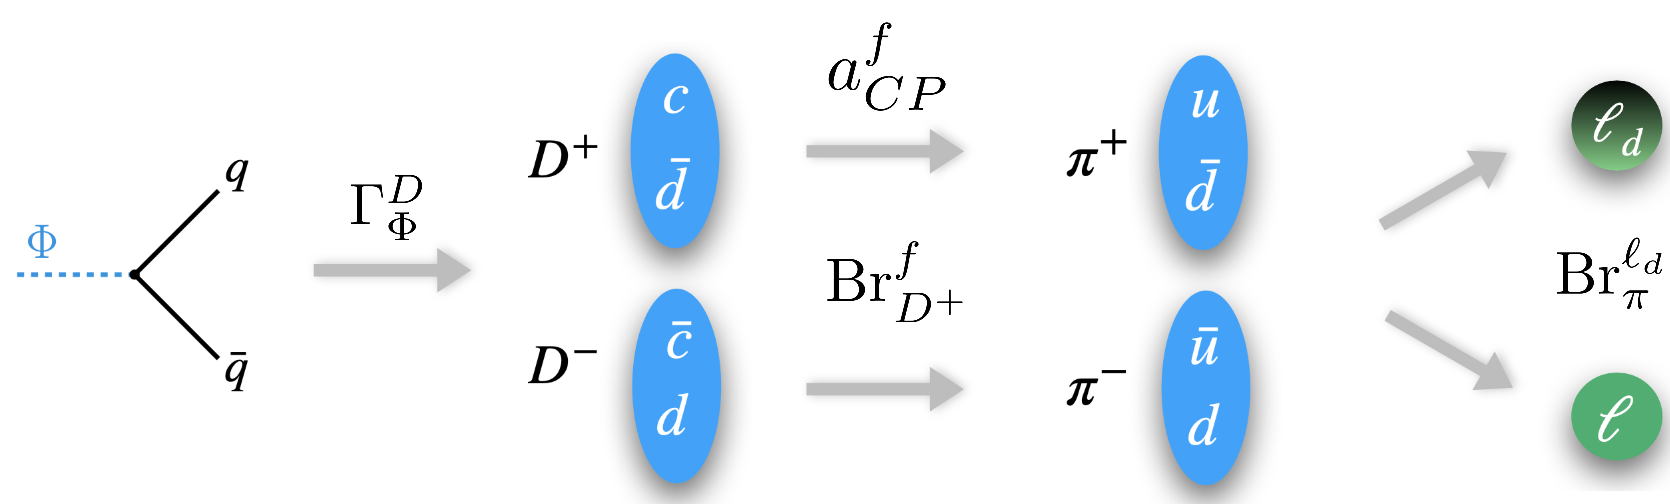
Equal and opposite dark and visible sector baryon asymmetry

G. Elor

Boltzmann Equations: Lepton Asymmetry

- Inflaton: $$\frac{dn_\Phi}{dt} + 3Hn_\Phi = -\Gamma_\Phi n_\Phi$$
- Radiation: $$\frac{d\rho_{\rm rad}}{dt} + 4H\rho_{\rm rad} = +\Gamma_\Phi m_\Phi n_\Phi$$
- Hubble: $$H^2 = \frac{8\pi}{3M_{\rm Pl}^2}\left(\rho_{\rm rad} + m_\Phi n_\Phi\right) \qquad \Gamma_\Phi = 4H\left(T_R\right)$$
- The dark lepton asymmetry: $\Gamma_\Phi^D \equiv \Gamma_\Phi {\rm Br}(\Phi \to c){\rm Br}(c \to D)$

$$\boxed{\frac{d}{dt}\left(n_{\ell_d} - n_{\bar{\ell}_d}\right) + 3H\left(n_{\ell_d} - n_{\bar{\ell}_d}\right) = 2\,\Gamma_\Phi^D n_\Phi {\rm Br}_\pi^{\ell_d} \sum_f N_\pi^f a_{CP}^f {\rm Br}_{D^+}^f}$$



G. Elor

Boltzmann Equations: Lepton Asymmetry

- Inflaton: $$\frac{dn_\Phi}{dt} + 3Hn_\Phi = -\Gamma_\Phi n_\Phi$$
- Radiation: $$\frac{d\rho_{\rm rad}}{dt} + 4H\rho_{\rm rad} = +\Gamma_\Phi m_\Phi n_\Phi$$
- Hubble: $$H^2 = \frac{8\pi}{3M_{\rm Pl}^2}\left(\rho_{\rm rad} + m_\Phi n_\Phi\right) \qquad \Gamma_\Phi = 4H\left(T_R\right)$$
- The dark lepton asymmetry: $\Gamma_\Phi^D \equiv \Gamma_\Phi {\rm Br}(\Phi \to c){\rm Br}(c \to D)$

$$\boxed{\frac{d}{dt}\left(n_{\ell_d} - n_{\bar{\ell}_d}\right) + 3H\left(n_{\ell_d} - n_{\bar{\ell}_d}\right) = 2\,\Gamma_\Phi^D n_\Phi {\rm Br}_\pi^{\ell_d} \sum_f N_\pi^f a_{CP}^f {\rm Br}_{D^+}^f}$$

Experimental Observables:

- SM charged D decays: $$a_{CP}^f \equiv A_{CP}^f/(1 + A_{CP}^f) \approx A_{CP}^f$$ $${\rm Br}_{D^+}^f \equiv {\rm Br}\left(D^+ \to f\right)$$ *LHCb, B factories*
- Charged pion decays: $${\rm Br}_\pi^{\ell_d} \equiv {\rm Br}\left(\pi^+ \to \ell_d + \ell^+\right)$$ *PIENU, PSI, etc.*

G. Elor

Boltzmann Equations: Lepton Asymmetry

Numerically Solving for the Lepton asymmetry:

$$\frac{Y_L^{\text{dark}}}{Y_B^{\text{obs}}} \simeq \frac{\text{Br}_\pi^{\ell_d}}{10^{-3}} \frac{\sum_f N_\pi^f a_{CP}^f \text{Br}_{D^+}^f}{3 \times 10^{-5}} \frac{T_\text{R}}{20\,\text{MeV}} \frac{10\,\text{GeV}}{m_\Phi}$$

$$Y_B^{\text{obs}} = (8.718 \pm 0.004) \times 10^{-11}$$

Experimental Observables:

- SM charged D decays: $a_{CP}^f \equiv A_{CP}^f/(1 + A_{CP}^f) \approx A_{CP}^f$, $\text{Br}_{D^+}^f \equiv \text{Br}\,(D^+ \to f)$ — *LHCb, B factories*
- Charged pion decays: $\text{Br}_\pi^{\ell_d} \equiv \text{Br}\,(\pi^+ \to \ell_d + \ell^+)$ — *PIENU, PSI, etc.*

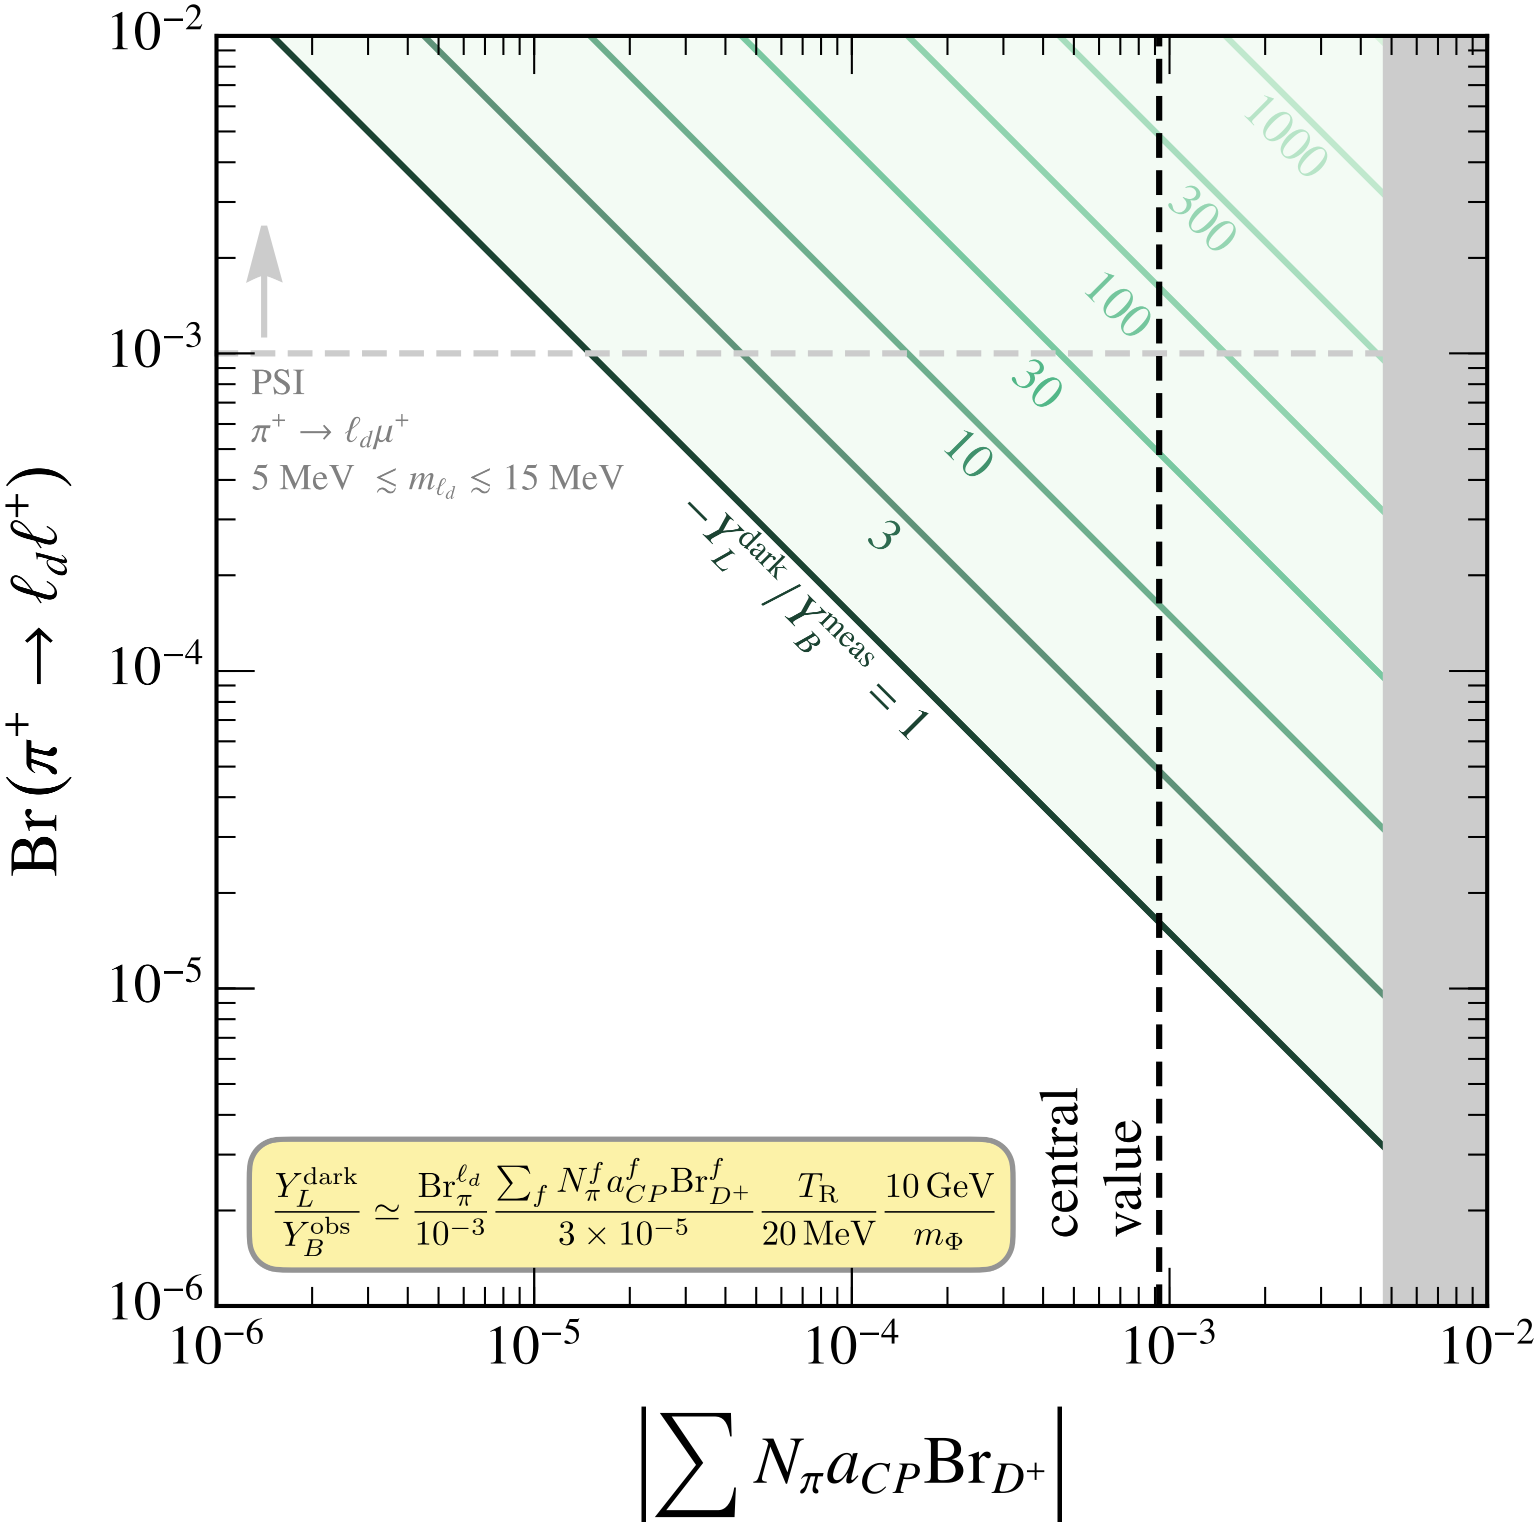
Generating a Lepton Asymmetry



G. Elor

Freezing-In a Baryon Asymmetry

Boltzmann Equations with scattering: $\bar{\ell}_d + \chi_1 \to \chi_2 + \mathcal{B}$

- New dark lepton/lepto-baryon: $m_\Phi \gtrsim m_{\chi_1} \quad m_\Phi \gtrsim m_{\chi_2} + m_{\mathcal{B}}$

$$\frac{dn_{\chi_1}}{dt} + 3Hn_{\chi_1} = \Gamma_\Phi n_\Phi \mathrm{Br}\left(\Phi \to \chi_1 \bar{\chi}_1\right) - \langle \sigma v \rangle n_{\bar{\ell}_d} n_{\chi_1}$$

- Dark lepton:

$$\frac{d}{dt}\left(n_{\ell_d} - n_{\bar{\ell}_d}\right) + 3H\left(n_{\ell_d} - n_{\bar{\ell}_d}\right) = 2\Gamma_\Phi^D n_\Phi \mathrm{Br}_\pi^{\ell_d} \sum_f N_\pi^f a_{CP}^f \mathrm{Br}_{D^+}^f - \langle \sigma v \rangle n_{\chi_1}\left(n_{\ell_d} - n_{\bar{\ell}_d}\right)$$

- Baryon asymmetry:

$$\boxed{\frac{d}{dt}\left(n_{\mathcal{B}} - n_{\overline{\mathcal{B}}}\right) + 3H\left(n_{\mathcal{B}} - n_{\overline{\mathcal{B}}}\right) = -\langle \sigma v \rangle n_{\chi_1}\left(n_{\ell_d} - n_{\bar{\ell}_d}\right)}$$

To efficiently transfer the asymmetry $\left.\frac{n_{\chi_1}\langle \sigma v \rangle}{H(T)}\right|_{T=T_R} \gtrsim \frac{Y_B^{\mathrm{obs}}}{Y_L^{\mathrm{dark}}}$

G. Elor

Freezing-In a Baryon Asymmetry

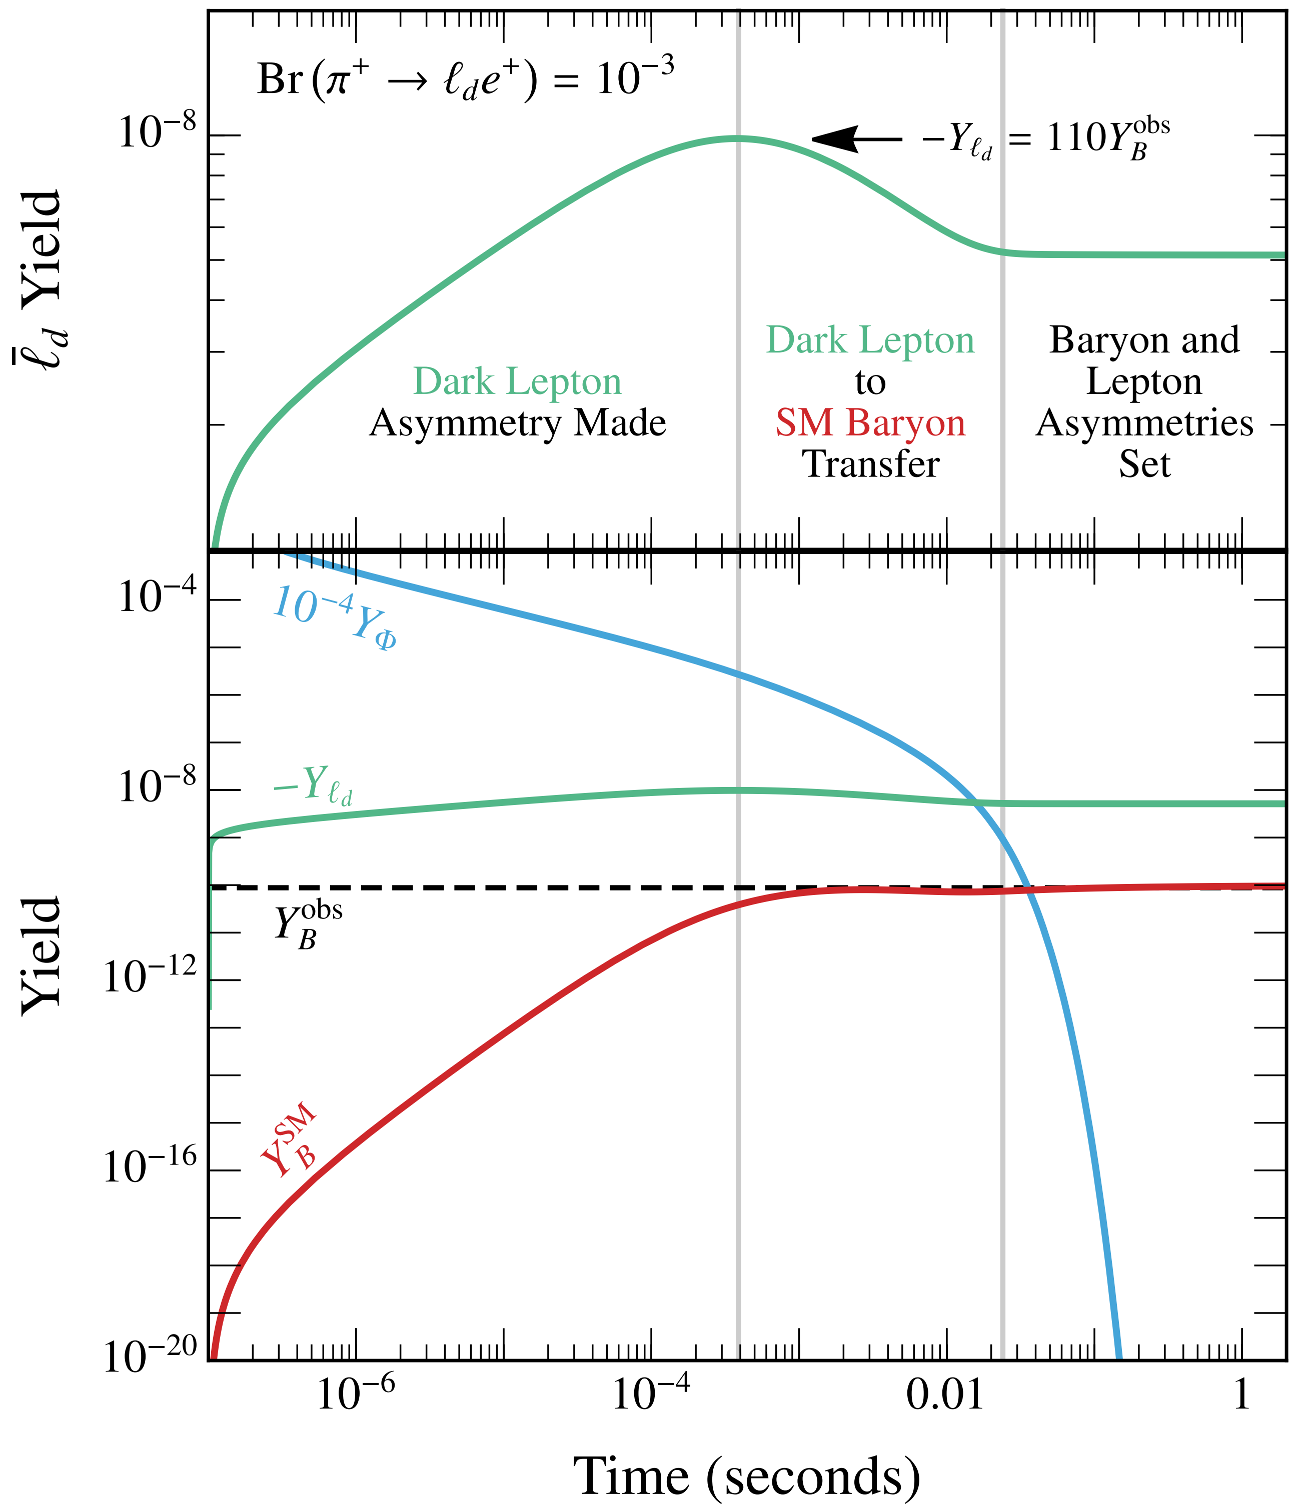
Example Benchmark point:

$$T_R = 10 \text{ MeV}, \; m_\Phi = 6 \text{ GeV}$$

$$\langle \sigma v \rangle = 1 \times 10^{-15} \text{ GeV}^{-2}$$

$$\text{Br}\left(\Phi \to \chi_1 \bar{\chi}_1\right) = 0.1$$

$$\sum_f N_\pi^f a_{CP}^f \text{Br}_{D^+}^f = \left(-9.3 \times 10^{-4}\right)$$



G. Elor

Freezing-In a Baryon Asymmetry

Numerically:

$$\boxed{\langle \sigma v \rangle \ \gtrsim\ 10^{-16}\,\mathrm{GeV}^{-2}\,\frac{Y_B^{\mathrm{obs}}}{Y_L^{\mathrm{dark}}} \times \frac{10\,\mathrm{GeV}}{m_\Phi}\frac{20\,\mathrm{MeV}}{T_R}\frac{10^{-1}}{\mathrm{Br}(\Phi \to \chi_1 \bar{\chi_1})}}$$

How realistic is this?

Models

Proof of concept that what I have told you thus far is not (too) crazy.

- Some example models/dark sector charge assignments.

$$\bar{\ell}_d + \chi_1 \to \chi_2 + \mathcal{B}$$

- Estimation of the scattering cross section to confirm it can be large enough to transfer the asymmetry given current constraints.

$$\langle \sigma v \rangle \ \gtrsim \ 10^{-16}\,\mathrm{GeV}^{-2}\,\frac{Y_B^{\mathrm{obs}}}{Y_L^{\mathrm{dark}}} \times \frac{10\,\mathrm{GeV}}{m_\Phi}\frac{20\,\mathrm{MeV}}{T_R}\frac{10^{-1}}{\mathrm{Br}(\Phi \to \chi_1 \bar{\chi_1})}$$

Portal to the Dark Sector

Model Build for: $\bar{\ell}_d + \chi_1 \rightarrow \chi_2 + \mathcal{B}$

New fields: (Same model as for B-Mesogenesis[arXiv:1810.00880])

	Field	Spin	L	B	$\mathbb{Z}_2$	Mass	
Color triplet scalar mediator	Y	0	0	$-2/3$	$+1$	$\gtrsim 1\,\mathrm{TeV}$	Collider bounds (as just discussed)
	ℓ_d	$1/2$	1	0	$+1$	$\mathcal{O}(10 - 140\,\mathrm{MeV})$	
Dark Baryon	ψ_B	$1/2$	0	-1	$+1$	$\gtrsim 1.2\,\mathrm{GeV}$	Stability of matter, neutron star bounds

Allowed Interactions: $\mathcal{L} \supset y_{u_i d_j} Y^* \bar{u}_i d_j^c + y_{\psi d_k} Y \bar{\psi}_B d_k^c + h.c.$

$$\mathcal{L}_{\text{eff}} = \frac{y^2}{M_Y^2} \bar{u}_i^c d_j d_k^c \psi_B$$ *dark baryon-SM baryon "mixing"*

G. Elor

Dark Possibilities

$$\bar{\ell}_d + \chi_1 \to \chi_2 + \bar{\psi}_B$$

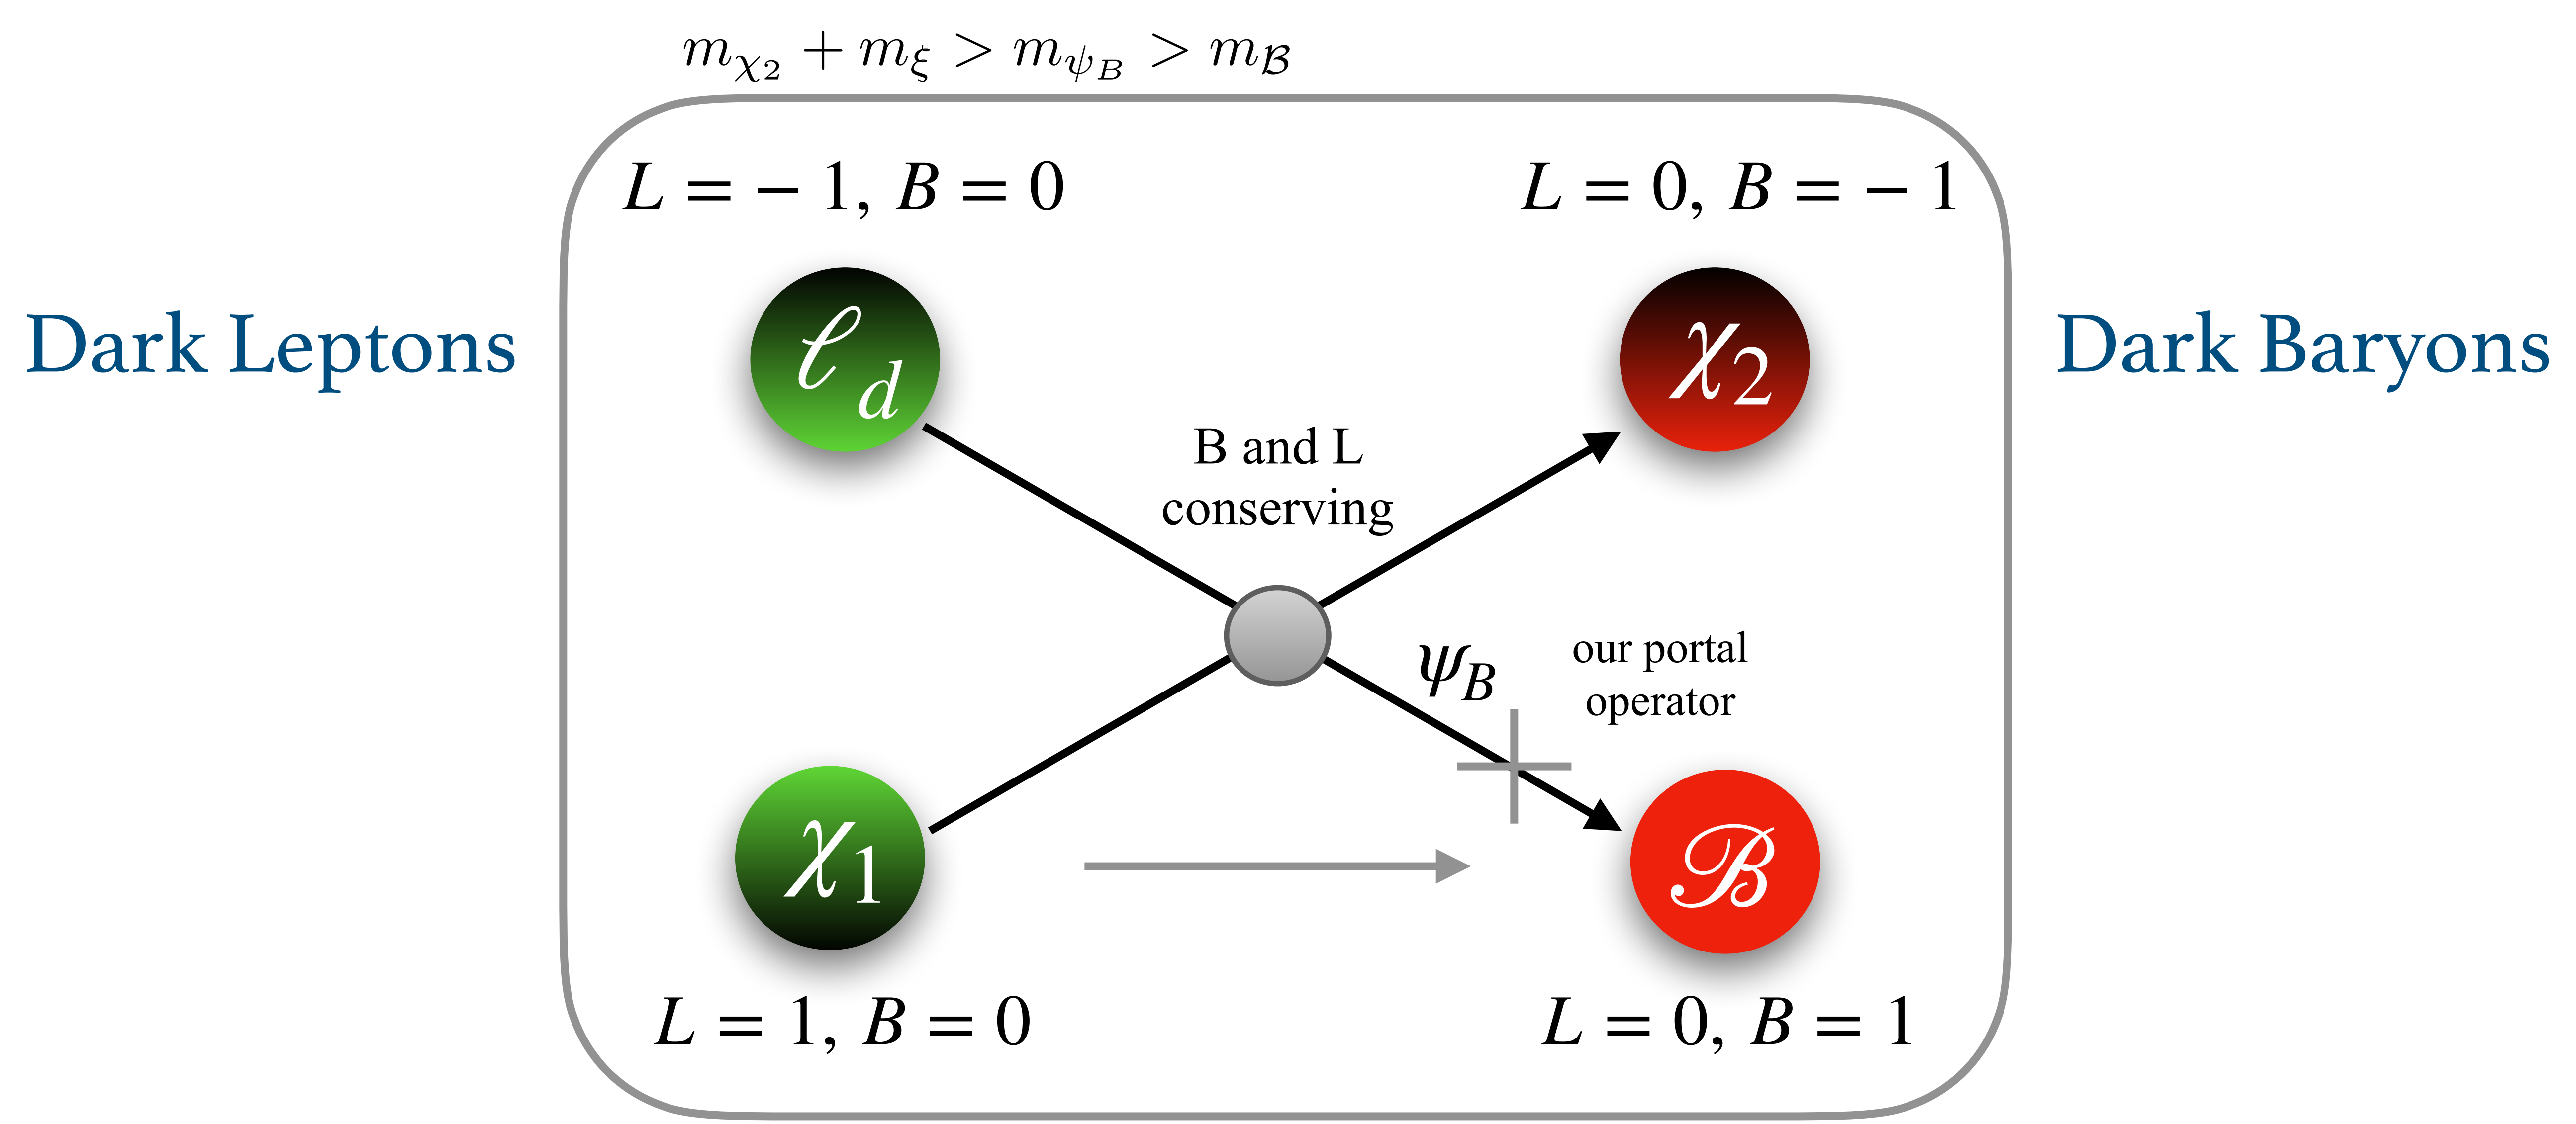
MeV scale Dirac Fermion mediator

G. Elor

Example Charge Assignment



$$\langle \sigma v \rangle \simeq 10^{-15}\,\mathrm{GeV}^{-2}\,(y_l\, y_b)^2 \times \left(\frac{10\,\mathrm{MeV}}{m_{\ell_d}}\right)\left(\frac{20\,\mathrm{GeV}}{m_{\chi_1}}\right)\left(\frac{10\,\mathrm{GeV}}{m_{\chi_2}}\right)$$

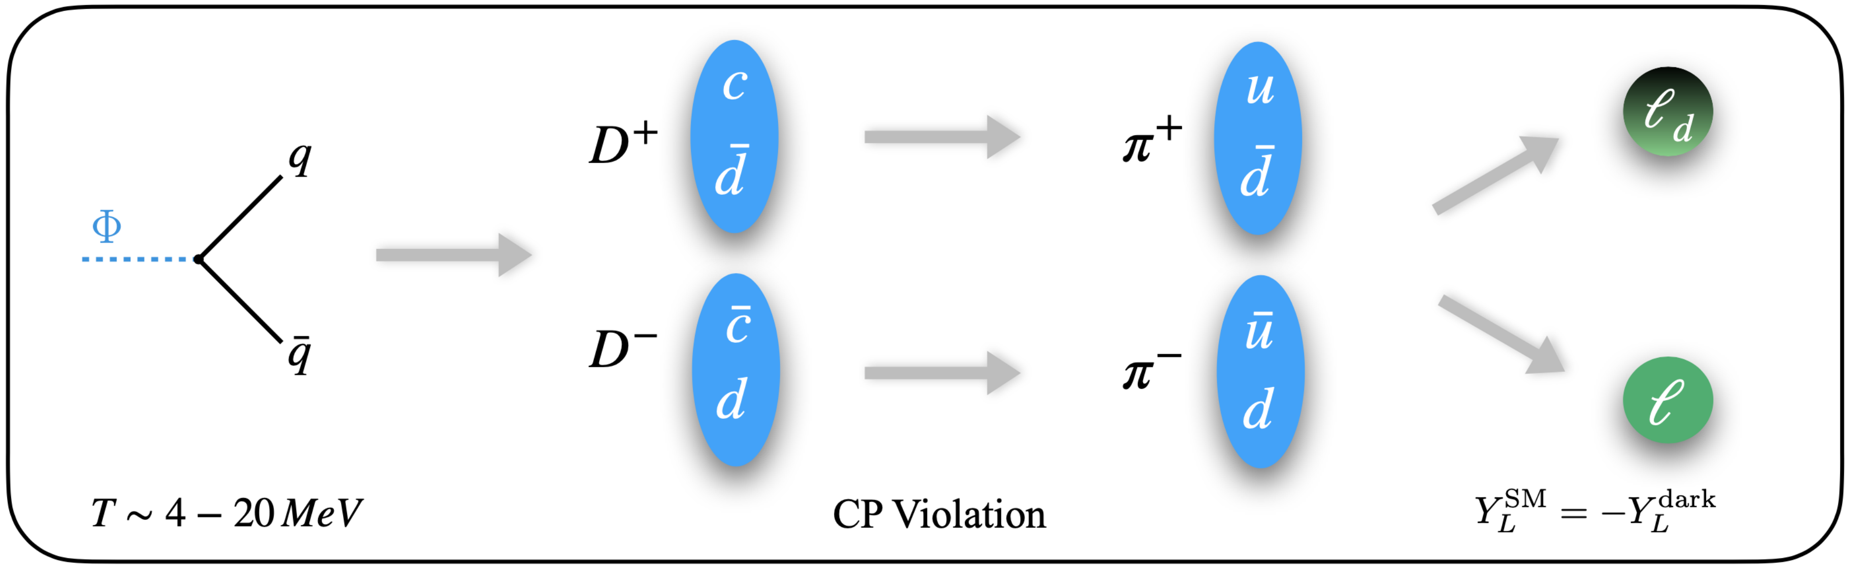
G. Elor

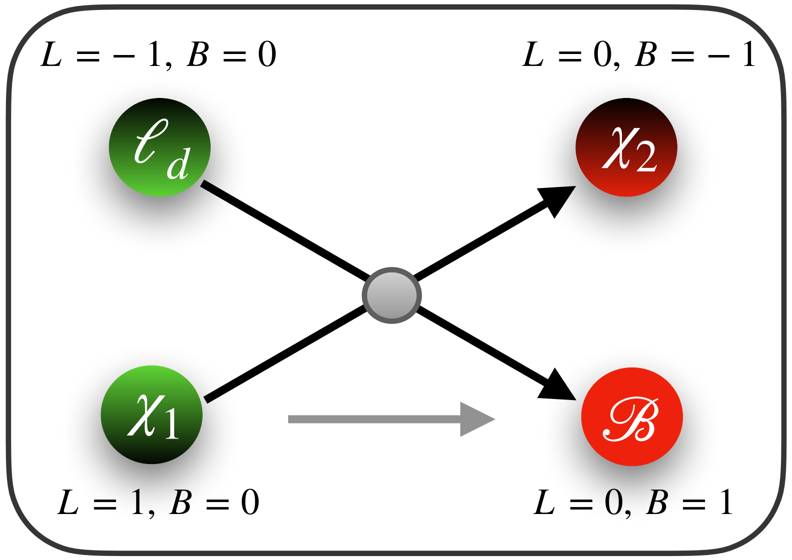
Dark Matter Generation

A few comments

- Details depend on baryon and lepton number charge assignment.
- Symmetric component of any dark baryons will always contribute to some or all of the dark matter.
- Dark states will tend to be overproduced but additional dark sector dynamics can always be at play to achieve the observed dark matter relic abundance.

D-Mesogenesis



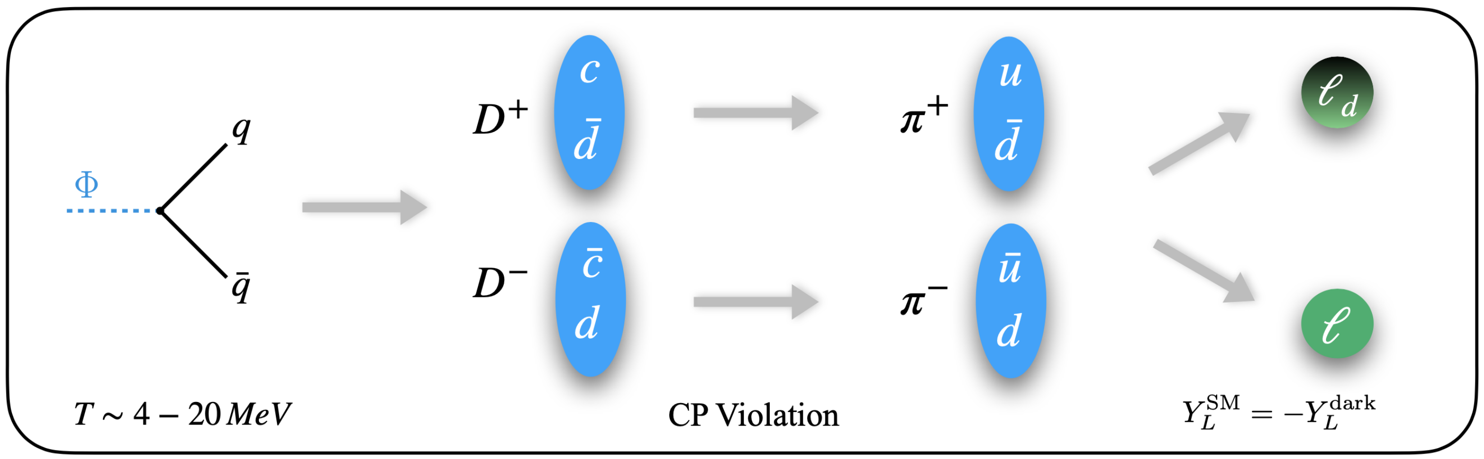


- First generates a lepton asymmetry and then freezes in a baryon asymmetry through dark sector scatterings.
- Baryogenesis and dark matter production are controlled by experimental observables of the charged D Mesons system.
- Upcoming experimental probes will better constrain or discover this mechanism.

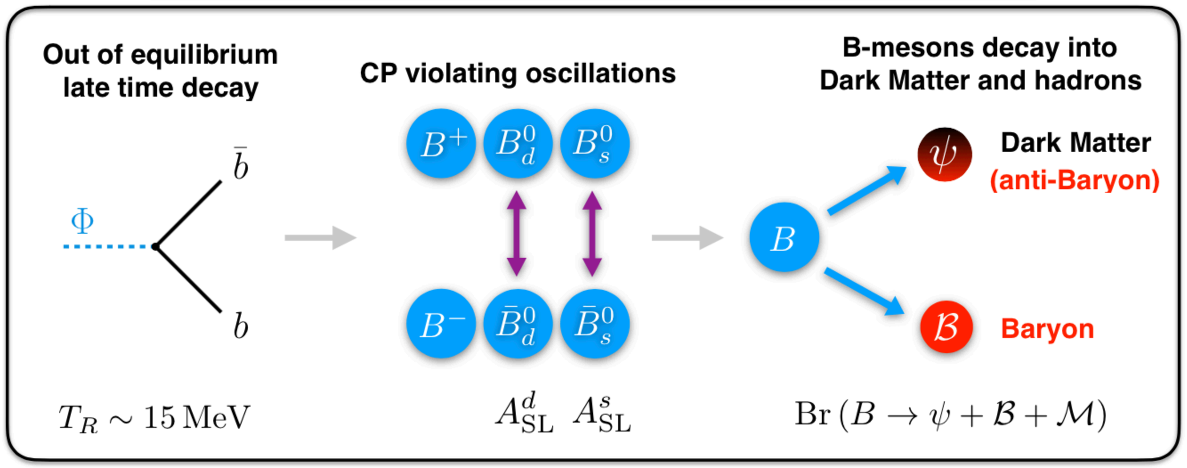
G. Elor

Outlook

D-Mesogenesis:



B-Mesogenesis:

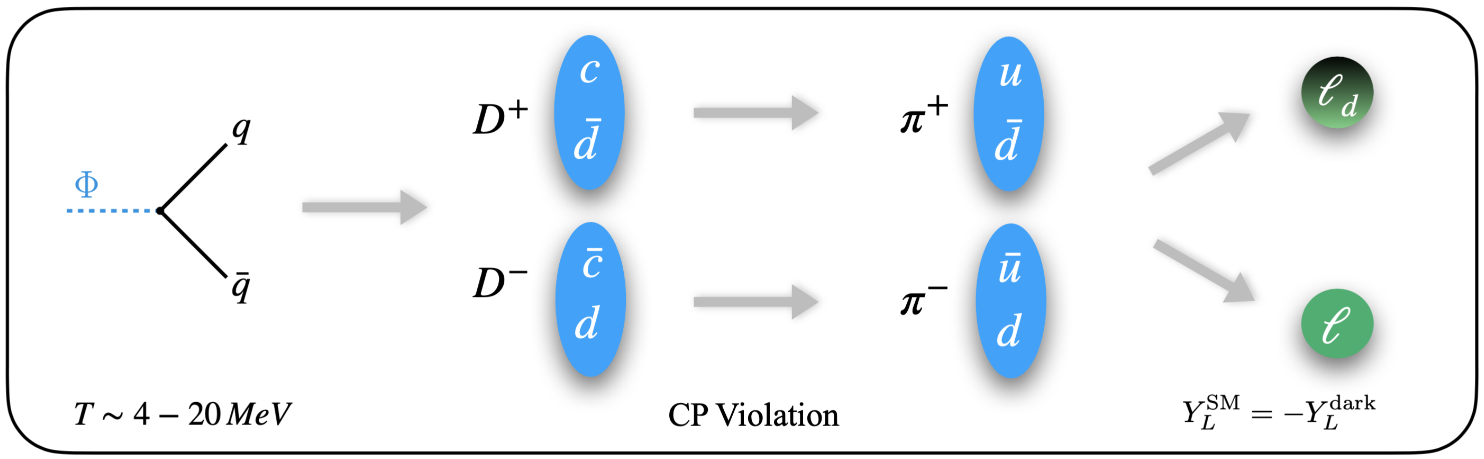


- Continued support of experimental efforts to probe Mesogenesis e.g. proper form factor calculation in the case of decays relevant for *B*-Mesogenesis.
- Mesogenesis in other meson systems?
- Explore UV embeddings (dark sector? mediators?) of both *B* and *D*-Mesogenesis and associated phenomenology.
- Theory of inflation and flavor.

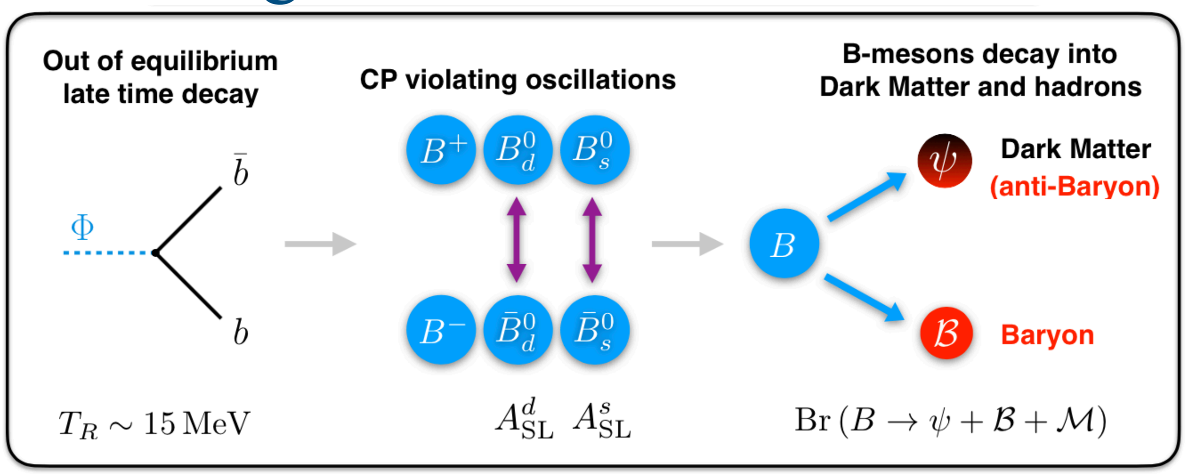
G. Elor

Outlook

D-Mesogenesis:



B-Mesogenesis:



- Continued support of experimental efforts to probe Mesogenesis e.g. proper form factor calculation in the case of decays relevant for *B*-Mesogenesis.

Flavorful Variations

No a priori reason to expect a particular flavor structure.

Most general interactions:

$$\mathcal{L}_{-1/3} = -\sum_{i,j} y_{u_i d_j} Y^\star \bar{u}_{iR} d^c_{jR} - \sum_k y_{\psi d_k} Y d^c_{kR} \bar{\psi} + \text{h.c.}$$

$$\mathcal{L}_{2/3} = -\sum_{i,j} y_{d_i d_j} Y^\star \bar{d}_{iR} d^c_{jR} - \sum_k y_{\psi u_k} Y u^c_{kR} \bar{\psi} + \text{h.c.}$$

Possible operators:

$$\mathcal{O}_{ud} = \psi\, b\, u\, d$$
$$\mathcal{O}_{us} = \psi\, b\, u\, s$$
$$\mathcal{O}_{cd} = \psi\, b\, c\, d$$
$$\mathcal{O}_{cs} = \psi\, b\, c\, s$$

New meson and b-flavored hadron decays:

Operator/Decay	Initial State	Final state	ΔM (MeV)
$\mathcal{O} = \psi\, b\, u\, d$ $\bar{b} \to \psi\, u\, d$	B_d	$\psi + n\,(udd)$	4340.07
	B_s	$\psi + \Lambda\,(uds)$	4251.21
	B^+	$\psi + p\,(duu)$	4341.05
	Λ_b	$\bar{\psi} + \pi^0$	5484.5
$\mathcal{O} = \psi\, b\, u\, s$ $\bar{b} \to \psi\, u\, s$	B_d	$\psi + \Lambda\,(usd)$	4163.95
	B_s	$\psi + \Xi^0\,(uss)$	4025.03
	B^+	$\psi + \Sigma^+\,(uus)$	4089.95
	Λ_b	$\bar{\psi} + K^0$	5121.9
$\mathcal{O} = \psi\, b\, c\, d$ $\bar{b} \to \psi\, c\, d$	B_d	$\psi + \Lambda_c + \pi^-\,(cdd)$	2853.60
	B_s	$\psi + \Xi_c^0\,(cds)$	2895.02
	B^+	$\psi + \Lambda_c\,(dcu)$	2992.86
	Λ_b	$\bar{\psi} + \overline{D}^0$	3754.7
$\mathcal{O} = \psi\, b\, c\, s$ $\bar{b} \to \psi\, c\, s$	B_d	$\psi + \Xi_c^0\,(csd)$	2807.76
	B_s	$\psi + \Omega_c\,(css)$	2671.69
	B^+	$\psi + \Xi_c^+\,(csu)$	2810.36
	Λ_b	$\bar{\psi} + D^- + K^+$	3256.2

A Supersymmetric Theory

MSSM, R Symmetry, and Dirac Gauginos and Sterile Neutrios

Superfield	R-Charge	L no.
$\mathbf{U}^c, \mathbf{D}^c$	$2/3$	0
$\mathbf{Q}$	$4/3$	0
$\mathbf{H}_u, \mathbf{H}_d$	0	0
$\mathbf{R}_u, \mathbf{R}_d$	2	0
$\mathbf{S}$	0	0
$\mathbf{L}$	1	1
$\mathbf{E}^c$	1	-1
$\mathbf{N}^c_R$	1	-1

"RPV" $\mathbf{W} = y_u \mathbf{Q}\mathbf{H}_u\mathbf{U}^c - y_d \mathbf{Q}\mathbf{H}_d\mathbf{D}^c - y_e \mathbf{L}\mathbf{H}_d\mathbf{E}^c + \frac{1}{2}\lambda''_{ijk}\mathbf{U}^c_i\mathbf{D}^c_j\mathbf{D}^c_k$

$$+ \mu_u \mathbf{H}_u\mathbf{R}_d + \mu_d \mathbf{R}_u\mathbf{H}_d$$

$$+ \lambda^t_u \mathbf{H}_u\mathbf{T}\mathbf{R}_d + \lambda^t_d \mathbf{R}_u\mathbf{T}\mathbf{H}_d + \lambda^s_d \mathbf{S}\mathbf{R}_u\mathbf{H}_d\,.$$

$$\rightarrow \quad \mathcal{L} = \lambda''_{113}\left(\tilde{d}^*_R u^\dagger_R b^\dagger_R + \tilde{u}^*_R d^\dagger_R b^\dagger_R + \tilde{b}^*_R u^\dagger_R d^\dagger_R\right)\,,$$

Gauge:

$$\mathcal{L}_{\text{gauge}} = -\sqrt{2}g(\phi T^a\psi^\dagger)\lambda^{a\dagger} + \text{h.c.}$$

$$\Rightarrow \quad -\sqrt{2}g(\tilde{d}^*_R d_R \tilde{B}^\dagger) - \sqrt{2}g(\tilde{d}_L d^\dagger_L \tilde{B}^\dagger) + \text{h.c.}$$

Neutrio:

$$\mathbf{W} = \frac{\lambda_N}{4}\mathbf{S}\mathbf{N}^c_R\mathbf{N}^c_R + \mathbf{H}_u\mathbf{L}^i y^{ij}_N \mathbf{N}^{c,j}_R + \frac{1}{2}\mathbf{N}^c_R M_M \mathbf{N}^c_R + \text{h.c.}\,,$$

$$\rightarrow \quad 4\lambda_N\left(\lambda_s \nu^\dagger_R \tilde{\nu}^*_R + \phi_s \nu^\dagger_R \nu^\dagger_R\right) + \text{h.c.}$$

Parameter space: "RPV" couplings and squark mass mixing

A Supersymmetric Theory

Superpartners and SM particles have different charge under an unbroken R-symmetry. We can identify this with Baryon number.

→ Superpartners as dark baryons.

	Field	Spin	Q_{EM}	Baryon no.	$\mathbb{Z}_2$	Mass
	Φ	0	0	0	$+1$	$11-100\,\text{GeV}$
MSSM Squark	$\tilde{d}_R$	0	$-1/3$	$-2/3$	$+1$	$\mathcal{O}(\text{TeV})$
Dirac Bino	$\begin{bmatrix} \tilde{B} \\ \lambda_s^\dagger \end{bmatrix}$	$1/2$	0	-1	$+1$	$\mathcal{O}(\text{GeV})$
Right handed neutrino multiplet	ν_R	$1/2$	0	0	-1	$\mathcal{O}(\text{GeV})$
	$\tilde{\nu}_R$	0	0	-1	-1	$\mathcal{O}(\text{GeV})$
